ABSTRACT

Schnute, J.T., Couture-Beil, A., Haigh, R., and Egeli, A. 2008. *PBS Modelling 2.00: user's guide* revised from Can. Tech. Rep. Fish. Aquat. 2674: v + 146 p. Last updated October 23, 2008.

This report describes the R package *PBS Modelling*, which contains software to facilitate the design, testing, and operation of computer models. The initials *PBS* refer to the Pacific Biological Station, a major fisheries laboratory on Canada's Pacific coast in Nanaimo, British Columbia. Initially designed for fisheries scientists, this package has broad potential application in many scientific fields. *PBS Modelling* focuses particularly on tools that make it easy to construct and edit a customized graphical user interface (GUI) appropriate for a particular problem. Although our package depends heavily on the R interface to Tcl/Tk, a user does not need to know Tcl/Tk. In addition to GUI design tools, *PBS Modelling* provides utilities to manage projects with multiple files, write lectures that use R interactively, support data exchange among model components, conduct specialized statistical analyses, and produce graphs useful in fisheries modelling and data analysis. Examples implement classical ideas from fishery literature, as well as our own published papers. The examples also provide templates for designing customized analyses using other R packages, such as *PBS Mapping*, *PBSddesolve*, *odesolve*, and *BRugs*. Users interested in building new packages can use *PBS Modelling* and a simpler enclosed package *PBS Try* as prototypes. An appendix describes this process completely, including the use of C code for efficient calculation.

Preface

After working with fishery models for more than 30 years, I’ve used a great variety of computer software and hardware. Currently, the free distribution of R (R Development Core Team 2006a) provides an excellent platform for software development in an environment designed to support multiple computers and operating systems. Furthermore, an associated network of contributed packages on the Comprehensive R Archive Network (CRAN: <http://cran.r-project.org/>) gives access to a wealth of algorithms from many users in various fields. This disciplined system allows users, like the authors of this package, to distribute software that extends the utility of R in new directions.

Previously I’ve used software in Basic (Schnute 1982), Fortran (Mittertreiner and Schnute 1985), Pascal, C, and C++ to implement ideas in published papers. Usually this software goes stale in time, due to minimal documentation, changing operating systems, the lack of portable libraries, and many other factors. Because R includes a rich library of statistical software that operates on multiple platforms, my colleagues and I can now distribute software that actually works when other people try it. The user community includes us, because we often find that we can’t remember how to operate our own software after a few weeks or months, let alone years. Although writing a good R package requires considerable effort, the result often pays off in portability, communication, and long term usage.

PBS Modelling tries to accomplish several goals. First, it anticipates the need for model exploration with a graphical user interface, a so-called GUI (pronounced gooey). We make this easy by encapsulating key features of Tcl/Tk into convenient tools fully documented here. A user need not learn Tcl/Tk to use this package. Everything required appears in Appendix A. You might want to start by running the function `testWidgets()`. Co-author Rowan Haigh likes the subtitle: “modelling the world with gooey substances.”

Second, we want to demonstrate interesting analyses related to our work in fishery management and other fields. The function `runExamples()` illustrates some of these, as described further in Section 7. The code for all of them appears in the R library directory `PBSmodelling\Examples`. We demonstrate the power of other R packages, such as `BRugs` (to perform Bayesian posterior sample with the application `WinBUGS`), `odesolve` (to solve differential equations numerically), `ddesolve` (to solve delay differential equations), and `PBSmapping` (to draw maps and perform spatial analyses).

Third, *PBS Modelling* serves as a prototype for building a new R package, as summarized in Appendix B. We illustrate two methods of calling C code (`.C` and `.Call`), and discuss many other technical issues encountered while building this package. The functions `compileC` and `loadC` (added in 2008) give direct support for dynamically adding C functions to the working R environment.

Finally, to use R effectively, we’ve found it convenient to devise a number of “helper” functions that facilitate data exchange, graphics, function minimization, and other analyses. We include these here for the benefit of our users, who may choose to ignore them. We hope that

PBS Modelling inspires interest in interactive models that demonstrate applications in many fields.

As with our earlier package *PBS Mapping*, Rowan and I employed a bright student who could learn quickly and implement creative ideas. Dr. Jim Uhl (Computing Science) and Dr. Lev Idels (Mathematics), both from Malaspina University-College (MUC) here in Nanaimo, drew my attention to the student Alex Couture-Beil, who has strong credentials in both fields. Rowan and I gave him a few initial specifications, and he quickly got ahead of us by extending our ideas in new and useful directions. This process continued in 2008, when we employed Anisa Egeli, another bright student from MUC. The current version of *PBS Modelling* represents the result of an evolutionary process, as we experimented with design concepts that would support our modelling goals. Users familiar with the earlier versions (starting with 0.60, posted on CRAN in August, 2006) may need to revise their code slightly to make it work with this version.

Since 1998, I have maintained a formal relationship with the Computing Science Department at MUC (now named Vancouver Island University – VIU), where I find kindred spirits in developing projects like this one. I particularly want to thank Dr. Jim Uhl for his suggestions and support on this project. Conversations with Dr. Peter Walsh have also stimulated my interest in the theory and application of computing science.

Fishery management depends on models with a great range of complexity, starting from some fairly simple ideas. Unfortunately from a coding perspective, “industrial strength” models can’t run exclusively in R. Algorithms with high computational requirements don’t run fast enough in R for practical application, due to interpretive code and other technical limitations. Examples in *PBS Modelling* often illustrate ideas at the simple end of the spectrum, although the package can certainly be used to manage external software designed to deal with greater complexity. The current version assists users in writing C code that can dramatically speed model performance.

Scientifically, I like to work from both ends of the spectrum. The behaviour of a complex model sometimes mimics a much simpler model, and it helps to become well versed in some of the simpler cases. I appreciate the motto of Canadian storyteller and humorist Stuart McLean, who hosts a CBC radio broadcast *The Vinyl Cafe* (<http://www.cbc.ca/vinylcafe/>), “We may not be big, but we’re small.”

Jon Schnute, December 2006; revised October 2008.

1. Introduction

This report describes software to facilitate the design, testing, and operation of computer models. The package *PBS Modelling* is distributed as a freely available package for the popular statistical program R (R Development Core Team 2006a). The initials *PBS* refer to the Pacific Biological Station, a major fisheries laboratory on Canada’s Pacific coast in Nanaimo, British Columbia. Previously, we produced the R package *PBS Mapping* (Schnute et al. 2004), which draws maps and performs various spatial operations. Although both packages (which can run separately or together) include examples relevant to fishery models and data analysis, they have broad potential application in many scientific fields.

Computer models allow us to speculate about reality, based on mathematical assumptions and available data. The full implications of a model usually require numerous runs with varying parameter values, data sets, and hypotheses. A customized graphical user interface (or GUI, pronounced “gooey”) facilitates this exploratory process. *PBS Modelling* focuses particularly on tools that make it easy to construct and edit a GUI appropriate for a particular problem. Some users may wish to use this package only for that purpose. Other users may want to explore the examples included, which demonstrate applications of likelihood inference, Bayesian analysis, differential equations, computational geometry, and other modern technologies. In constructing these examples, we take advantage of the diversity of algorithms available in other R packages.

In addition to GUI design tools, *PBS Modelling* provides utilities to support data exchange among model components, conduct specialized statistical analyses, and produce graphs useful in fisheries modelling and data analysis. Examples implement classical ideas from fishery literature, as well as our own published papers. The examples also provide templates for designing customized analyses using the R packages discussed here. In part, *PBS Modelling* provides a (very incomplete) guide to the variety of analyses possible with the R framework. We anticipate many revisions, as we find time to include more examples.

PBS Modelling depends heavily on Peter Dalgaard’s (2001, 2002) R interface to the Tcl/Tk package (Ousterhout 1994). This combines a scripting language (Tcl) with an associated GUI toolkit (). We simplify GUI design with the aid of a “window description file” that specifies the layout of all GUI components and their relationship with variables in R. We support only a subset of the possibilities available in Tcl/Tk, but we customize them in ways intended specifically for model design and exploration (Appendix A). A user of *PBS Modelling* does not need to know Tcl/Tk.

Computer models typically involve a variety of components, such as code, data, documentation, and a user interface. Figure 1 illustrates the tangled relationships that sometimes accompany computer model design. *PBS Modelling* allows the GUI to become a device for organizing components, as well as running and testing software (Figure 2). The project might involve other applications, as well as R itself. In addition to its interactive role, the GUI becomes an archival tool that reminds the developer how components, functions, and data tie together. Consequently, it facilitates the process of restarting a project at a future date, when details of the design may have been forgotten.

Figure 1. Tangled relationships among computer model components.

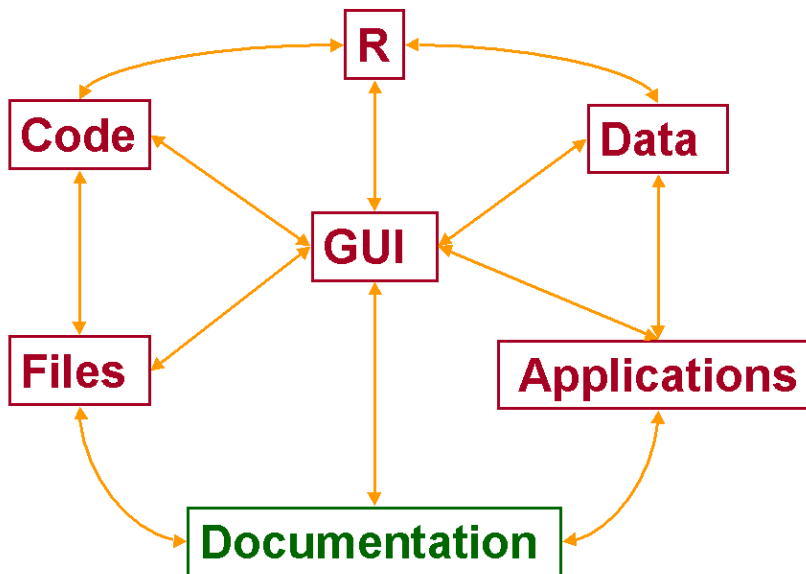

Figure 2. Computer model components organized with a graphical user interface (GUI).

In *PBS Modelling*, project design normally begins with a text file that describes the GUI. Additional files may contain code for R and other applications, which sometimes require languages other than R. For example, the R *BRugs* package (to perform Bayesian inference using Gibbs sampling) requires a file with the intended statistical model, written in the language of a separate program *WinBUGS*. In other contexts, a user might write C code to get acceptable performance from model components that require extensive computer calculations. This code might be compiled as a separate program or linked directly into a customized R package.

Section 2 of this report describes the process of designing a GUI to operate a computer model. Components can share data through text files in a specialized “PBS format” presented in

Section 3. These correspond naturally to `list` objects within R. Section 4 describes additional tools for customized graphics and data analysis. Sections 5 and 6 discuss tools developed in 2008 for managing projects (like C code development) and writing lectures that use R interactively. In Section 7, we highlight briefly some of the examples in our initial release, although we expect the list to expand in future versions. This guide explains the context and general purpose of all functions in *PBS Modelling*. Consult the help files for complete technical details.

Appendix A gives the complete syntax for all visual components (called *widgets*) available for writing a window description file to construct a customized GUI. Appendix B provides syntax detail for talk description files. Appendix C describes the process of building *PBS Modelling* in a Windows environment. A simple enclosed package *PBS Try* gives a prototype for building any R package, including the use of C code to speed calculations. Appendix D shows the help files included with the package.

To use *PBS Modelling*, run R and install the package from the R GUI (click “Packages”, “Install package(s)...”, select a mirror, and choose `PBSmodelling` from the list of packages). Windows users can also obtain an appropriate compressed file from the authors of this report or directly from the CRAN web site <http://cran.r-project.org/>.

The R GUI normally runs as a Multiple Document Interface (MDI), in which child windows like the R console and graphics screens all appear within the GUI itself and a menu item can be used to tile the sub-windows. Unfortunately, in this configuration, windows generated by Tcl/Tk sometimes disappear mysteriously when an application runs. They can be recovered by clicking the appropriate “*TK*” icon on the taskbar. You can avoid this problem by using the Single Document Interface (SDI), in which the operating system manages all R windows (console, graphics, Tcl/Tk, etc.) independently on the desktop. Set this configuration by running the R GUI, choosing the menu items `<Edit>` and `<GUI Preferences>`, and then selecting and saving the SDI option. Alternatively, go to the master configuration file `Rconsole` in the `\etc` subdirectory of the R installation, and use a text editor to select the option `MDI = no`.

2. GUI tools for model exploration

The practical task of writing appropriate code for the R Tcl/Tk package can sometimes become daunting, particularly if the GUI window requires extensive design and change. For a restricted set of *TK* components (called *widgets*), *PBS Modelling* makes it much easier to design and use GUIs for exploring models in R. A user needs to supply two key parts of a GUI-driven analysis:

- a window description file (an ordinary text file) that completely specifies the desired layout of widgets and their relationship with functions and variables in R, and
- R code that defines relevant functions, variables, and data.

This section begins with an example to illustrate the main ideas, and then gives complete details for constructing window description files that can be used to generate GUIs.

2.1. Example: Lissajous curves

A Lissajous curve (<http://mathworld.wolfram.com/LissajousCurve.html>), named after one of its inventors Jules-Antoine Lissajous, represents the dynamics of the system

$$x = \sin(2\pi mt), \quad y = \sin[2\pi(nt + \phi)], \quad (1)$$

where time t varies from 0 to 1. During this time interval, the variables x and y go through m and n sinusoidal oscillations, respectively. The constant ϕ , which lies between 0 and 1, represents a cycle fraction of phase shift in y relative to x . We want to design a GUI that allows us to explore this model by plotting Lissajous curves (y vs. x) for various choices of the parameters (m, n, ϕ) . We also want to vary the number of time steps k and choose a plot that is either lines or points.

Table 1. Two text files associated with the “Lissajous Curve” project. The first gives a description of the GUI window used to manage the graphics. The second contains R code to draw a Lissajous curve.

File 1: LissajousCurve.txt

```
window title="Lissajous Curve"
vector length=4 names="m n phi k" \
  labels="'x cycles' 'y cycles' 'y phase' points" \
  values="2 3 0 1000"
radio name=ptype text=lines value="l" mode=character
radio name=ptype text=points value="p" mode=character
button text=Plot function=drawLiss
```

File 2: LissajousCurve.r

```
drawLiss <- function() {
  getWinVal(scope="L");
  tt <- 2*pi*(0:k)/k;
  x <- sin(2*pi*m*tt); y <- sin(2*pi*(n*tt+phi));
  plot(x,y,type=ptype);
  invisible(NULL); }
```

This analysis can be accomplished with the R code and window description file shown in Table 1. Assume that these two files reside in the current working directory and that *PBS Modelling* has been installed in R. Start an R session from this directory, and type the following three lines of code in the R command window:

```
> require(PBSmodelling)
> source("LissajousCurve.r")
> createWin("LissajousCurve.txt")
```

The first line assures that *PBS Modelling* is loaded, the second defines the function `drawLiss` for drawing Lissajous curves, and the third creates a window that can be used to draw curves corresponding to any choice of parameters. Figure 3 shows the resulting GUI window interface. When the `<Plot>` button is clicked, the curve in Figure 4 appears in the R graphics window. This corresponds to the default parameter values:

$$m = 2, n = 3, \phi = 0, k = 1000. \quad (2)$$

The GUI allows different Lissajous figures to be drawn easily. Simply change parameter values in any of the four entry boxes, and click `<Plot>`.

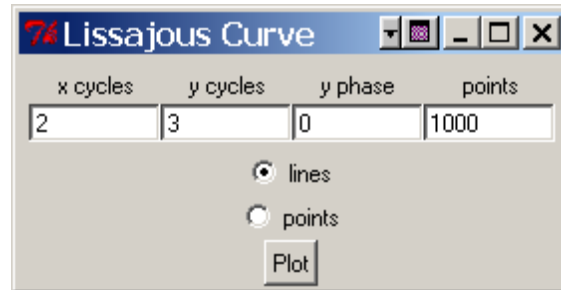

Figure 3. GUI generated by the description file `LissajousCurve.txt` in Table 1. It contains five widgets: the window titled “Lissajous Curve”, a vector of four entries, two linked radio buttons (`<lines>` and `<points>`), and a `<Plot>` button.

Figure 4. Default graph for the “Lissajous Curve” project, obtained by clicking the `<Plot>` button in Figure 3. The x variable goes through two cycles while the y variable goes through 3 cycles. A line graph is drawn through 1,000 points generated by the algorithm (1).

The window description file (Table 1) specifies a window titled “Lissajous Curve” with a vector of four entries. These correspond to quantities with the R variable names `m`, `n`, `phi`, and `k`. The corresponding window (Figure 3) will contain four entry boxes that allow these quantities to be changed. A label for each quantity emphasizes its conceptual role: the number of cycles for x or y , the phase shift for y , and the number of points plotted. Initial values correspond to those listed in (2). The backslash (`\`) character indicates that a widget description (in this case, a vector) continues on the next line. A pair of `radio` buttons, both corresponding to an R variable named `ptype`, allow selection between “lines” and “points” when drawing the plot. The graph (Figure 4) is actually drawn (i.e., the R function `drawLiss` is called) when the user presses a button that contains the text “Plot”. In, we use the symbols `<...>` to designate a button or keystroke, such as the `<Plot>` button or the radio buttons `<lines>` and `<points>`. These symbols are not to be confused with *talk description file* tags (`<>`) used later (Section 6).

The file of R code (Table 1) implements the algorithm (1) for computing k points on a Lissajous curve. The function `drawLiss` has no arguments, but gets values of the R variables `m`, `n`, `phi`, `k`, and `ptype` from the GUI window via a call to the *PBS Modelling* function `getWinVal`. The argument `scope="L"` implies that these variables have local scope within this function only. (Another choice `scope="G"` would give the variables global scope by writing them to the user’s global environment `.GlobalEnv`.)

2.2. Window description file

A window description file currently supports the following 18 widgets:

1. `window` – an entire new window;
2. `menu` – a menu grouping;
3. `menuitem` – an item in a menu;
4. `grid` – a rectangular block for placing widgets;
5. `label` – a text label;
6. `button` – a button linked to an R function that runs a particular analysis and generates a desired output, perhaps including graphics;
7. `check` – a check box used to turn a variable on or off, with corresponding values `TRUE` or `FALSE`;
8. `radio` – one of a set of mutually exclusive radio buttons for making a particular choice;
9. `null` – a blank widget that can occupy an empty space in a grid;
10. `entry` – a field in which a scalar variable (number or string) can be altered;
11. `text` – an entry box that supports multiple lines of text;
12. `vector` – an aligned set of entry fields for all components of a vector;
13. `matrix` – an aligned set of entry fields for all components of a matrix;
14. `data` – an aligned set of entry fields for all components of a data frame, where columns can have different modes;
15. `object` – an aligned set of entry fields defined by an existing R-object (vector, matrix, or data frame);
16. `slide` – a slide bar that sets the value of a variable;

17. `slideplus` – an extended slide bar that also displays a minimum, maximum, and current value;
18. `history` – a device for archiving parameter values corresponding to different model choices, so that a “slide show” of interesting choices can be preserved.

The description file is an ordinary text file that specifies each widget on a separate line. However, any one widget description can span multiple lines by using a backslash character (`\`) to indicate the end of an incomplete line. For example, the single line:

```
label text="Hello World!"
```

is equivalent to:

```
label \  
  text="Hello World!"
```

Meaningful indentation is highly recommended, but not compulsory. The three-line description of a vector widget in Table 1 illustrates a readable style.

Each widget has named arguments that control its behaviour, analogous to the named arguments of a function in R. Some (required) arguments must be specified in the widget description. Others (not required) can take default values. All widgets have a `type` argument equal to one of the 18 names above, although the word `type` can be omitted in the description file. Appendix A gives an alphabetic list of all these widgets, along with detailed descriptions of all arguments. As in calls to R functions, argument names can be omitted as long as they conform to the order specified in the detailed widget descriptions given below. Nevertheless, we recommend that all argument names be specified, except possibly the name `type`, which is always the first argument for each widget. Unlike R functions, where commas separate arguments, the arguments in a widget description are separated by white space.

In a description file, all argument values are treated initially as strings. In addition to specifying a line break, the backslash can be used to indicate five special characters: single quote `\'`, double quote `\"`, tab `\t`, newline `\n`, and backslash `\\`. If an argument value does not include spaces or special characters, then quotes around the string are not required. Otherwise, double quotes must be used to delineate the value of an argument. Single quotes indicate strings nested within strings. For example, the `vector` in Table 1 has four labels specified by the string argument

```
labels="'x cycles' 'y cycles' 'y phase' points"
```

A hash mark (`#`) that is not within a string begins a comment, where everything on a line after the hash mark is ignored. As mentioned above, an isolated backslash (not part of a special character) indicates continuation onto the next line. A break can even occur in the middle of a string, such as the long label

```
label text="This long label with spaces \  
  spans two lines in the description file"
```

In this case, leading spaces in the second line are ignored, to allow meaningful formatting in the description file. Intentional spaces in a long string should appear prior to the backslash on the first line.

Although the `type` argument (like `vector`) for a widget can never be abbreviated, other arguments follow the convention used with named arguments in R function calls. For a given widget type, the available arguments can be abbreviated, as long as the abbreviations uniquely identify each argument. For example, the `vector` in Table 1 could be specified as:

```
vector len=4 nam="m n phi k" \
      lab="'x cycles' 'y cycles' 'y phase' points" \
      val="2 3 0 1000"
```

Unlike variable names in R, widget names and their arguments are not case sensitive. Some users may prefer to write all `type` variables in upper case or with an initial capital letter. For example, the names `WINDOW`, `VECTOR`, `RADIO`, and `BUTTON` could be used to emphasize the widgets in Table 1.

2.3. Window support functions

PBS Modelling includes functions designed to connect R code with GUI windows. Every window has a name argument (with default `name=window`), and windows with different names can coexist. Window names must use only letters and numbers; they cannot contain a period (dot) or any other punctuation. When running a program with multiple windows, only one window will be current (i.e., selected by the user) at any particular time. Normally, a user selects a window by clicking on it, but the function `focusWin` allows program control of the window currently in focus. Thus, activity in one window might be used to shift the focus to another.

The function `createWin` uses a description file to generate one or more windows, where each window has a distinct name (perhaps the default) taken from the file. If a window with the specified name already exists, it will be closed before the new window is opened. When designing and testing a GUI, this feature ensures that a new version automatically replaces the previous one. The function `closeWin`, which takes a vector of window names, closes all windows named in the vector. With no arguments, `closeWin()` closes all windows that are currently open.

Although `createWin` normally builds a GUI from a description file, it will also accept a vector of strings equivalent to such a file. Thus, a file of R source code can define a GUI directly, without the need for a separate description file. illustrates how this can be done in a simple case. To see the character vectors equivalent to a given description file (say, `winDesc.txt`), type the R command:

```
scan("winDesc.txt", what=character(), sep="\n")
```

In particular, if the description file includes a backslash or double quote character, the corresponding R string must represent it as `\\` or `\`, respectively. Despite this alternative of embedding window descriptions in R source files, we recommend writing separate files to define GUIs, except perhaps for very simple models.

Table 2. A simple file of R source code with character strings that define a GUI. No separate window description file is required.

File: Simple.r

```
# window description strings
winStr=c(
  "window",
  "entry name=n value=5",
  "button function=myPlot text=\"Plot sinusoid\"");

# function to plot a sinusoid
myPlot <- function() {
  getWinVal(scope="L");
  x <- seq(0,500)*2*n*pi/500;
  plot(x,sin(x),type="l"); };

# commands to create the window
require(PBSmodelling); createWin(winStr,astext=TRUE)
```

Internally, *PBS Modelling* converts a description file into a list object that is used to generate the corresponding GUI. The functions `compileDescription` and `parseWinFile` give lists that correspond to description files. Just as `createWin` can act directly on a character vector, it can also act on a suitably defined list, rather than a file. This feature makes it possible to replace a description file with R code that defines the corresponding list, although we recommend against this practice in most cases.

R programs need to share data with a GUI window. *PBS Modelling* provides six functions that deal with values of R variables named in a description file:

- `getWinVal` returns values from the current window;
- `setWinVal` sets values in the current window;
- `getWinAct` returns all actions (up to a maximum of 50) invoked in the current window;
- `setWinAct` adds an action to the action vector for the current window;
- `getWinFun` returns the names of all R functions referenced in the current window;
- `clearWinVal` clears global values associated with the current window.

Some models make use of a single parameter vector. In such cases the function `createVector` generates a GUI directly, without the need for a corresponding description file. We also offer a few “choosing” functions – `getChoice` and `chooseWinVal` – that invoke a prompting GUI offering string choices. The latter writes the choice to a variable in a GUI specified by the user.

After using `createWin` to produce a GUI, the functions `getWinVal` and `getWinFun` provide useful summaries of names declared in the current project. Furthermore, the function `getWinAct` provides a record of GUI actions taken by the user, starting with the most recent and working backwards. By default, the `action` associated with a widget is its type; for example a button has default `action=button`. In general, however, the

description file could give a unique action name to each potential action, so that the vector would give an unambiguous record of user actions.

Two functions provide support for selecting a file from a GUI:

- `promptOpenFile` shows the current directory for choosing a file to open;
- `promptSaveFile` shows the current directory for naming a file to save.

Files can be opened in programs external from R depending on their file extension:

- `openFile` opens a file using the default program for the file extension;
- `setPBSext` overrides the default program associated with an extension;
- `getPBSext` shows the overridden file extension and associated program.
- `clearPBSext` clears file extensions added by `setPBSext`.

If a widget invokes the function `openFile`, the associated action should be the file name. By definition, `openFile` has the default argument `getWinAct()[1]`.

On a Windows platform, the native R function `shell.exec` (called by `openFile`) automatically chooses a default from the registry. For this reason, our distribution specifies an empty list:

```
getPBSext() returns list().
```

The default can, however, be overwritten by specifying explicit list components, such as:

```
setPBSext('html',  
  '"c:/Program Files/Mozilla Firefox/firefox.exe" file://%f')
```

where `%f` denotes the file name in the string passed to the operating system. Unix platforms typically lack such generic file associations, and thus require a user to specify defaults this way.

PBS Modelling includes a `history` widget designed to collect interesting choices of GUI variables so that they can be redisplayed later, rather like a slide show. This widget has buttons to add and remove GUI settings from the current collection, to scroll backward and forward, and to clear all entries from the collection. Other buttons allow entire history files to be saved or loaded. The `history` widget defines and uses the list `PBS.history` in the global environment to store a saved history.

Normally, a user would invoke a `history` widget simply by including a reference to it in the description file. However, *PBS Modelling* includes some support functions for customized applications:

- `initHistory` initializes data structures for holding a collection of history data;
- `addHistory` saves the current window settings to the current history record;
- `rmHistory` removes the current record from the history;
- `backHistory` and `forwHistory` move backward and forward between successive history records;
- `firstHistory` and `lastHistory` move to the first and last records in the history;
- `jumpHistory` moves to a specified record in the history;
- `exportHistory` and `importHistory` save and load histories from files;

- `clearHistory` removes all records from the current collection.

The help file for `initHistory` shows an example that uses these functions directly.

2.4. Internal data

PBS Modelling uses the hidden list variable `.PBSmod` in the global environment to store current settings and internal information needed to communicate with the `tcl/tk` interface. This variable is intended for exclusive use by *PBS Modelling*, and users should not alter or delete it while *PBS Modelling* is active. We include the material in this section for advanced users and developers interested in further details about the internal data used to manage GUI windows.

The list `.PBSmod` contains a named component for each open window, where the component name matches the window name. Recall that, if a window is not named explicitly, it receives the default `name=window`. In addition to window names, `.PBSmod` contains two other named components: `$.activeWin` and `$.options`. These names do not conflict with the window names, because the latter cannot include a dot (`.`). The `$.activeWin` component stores the name of the window that has most recently received user input. The `$.options` component saves key values of interest to *PBS Modelling*, such as a component `$openfile` with information that links programs to file extensions for the function `openFile`. See Section 2.3 for further information.

Any named component of `.PBSmod` that does not start with a dot stores information related to the corresponding window. Each window uses a list with the following named components:

- `widgetPtrs`
A list containing widget pointers. Each component has a name that matches widget name. Only widgets with a `name` argument and a corresponding `tk` widget will appear in this list.
- `widgets`
A list containing information from the window description file relevant to each widget. This list includes every widget that has a `name` or `names` argument. Widgets without names will never be referenced again after the window has been created; consequently, information about them is not stored for later usage.
- `tkwindow`
A pointer to the window created by `tktoplevel()`.
- `functions`
A vector of all function names referenced in the window description.
- `actions`
A vector containing `action` strings corresponding to the most recent user actions in the window, up to a maximum of 50. (The internal constant `.maxActionSize` sets this upper limit. See the file `defs.R` in the distribution source code.)

Users can explore the contents of `.PBSmod` with the R structure command `str`. For example, from the R console, type `runExamples()` and select the example “CalcVor”. Then type the command `str(.PBSmod, 2)` to show the list structure to a depth of 2. This reveals

all the list components discussed above. Further details appear by exploring the structure to depths 3, 4, or more. Notice also how the contents change as different examples are selected.

The functions `getWinVal`, `setWinVal`, `getWinAct`, `setWinAct`, `getWinFun`, `getPBSext`, and `setPBSext` (discussed in Section 2.3) provide methods for manipulating and retrieving variables stored in `.PBSmod`. Use these, rather than direct access, to alter the internal data. Future design modifications to *PBS Modelling* might change the architecture for storing the data components, but the methods functions will continue to have their current effect.

Table 3. Sample data file for *PBS Modelling*. The function `readList` converts this file to a list object with six components: a scalar `$x`, a logical vector `$y`, two matrices (`$z`, `$a`), and two data frames (`$b1`, `$b2`). The matrix `$a` is read by column, and `$b1`=`$b2`.

```
$x
0

$y
T F TRUE FALSE

$z
11.1 12.2 13.3 14.4
15.5 16.6 17.7 1.88e+01

$a
$$matrix ncol=2 byrow=FALSE colnames="a b"
5 1 2 3

$b1
$$data ncol=3 modes="numeric logical character" \
  byrow=TRUE colnames="N L C"
5 T aa
3 F bb
8 T cc
10.5 F dd

$b2
$$data ncol=3 modes="numeric logical character" \
  byrow=FALSE colnames="a b c"
5 3 8 10.5
T F T F
aa bb cc dd
```

3. Functions for data exchange

Computer models usually require data exchange between model components. For example, as described above, the functions `getWinVal` and `setWinVal` move data between an R program and the GUI. Other applications, such as those written separately in C, may have the ability to write data to files that R can read. In cases like this, it would be convenient to have variable names in the C code correspond to variables with the same names in R. *PBS Modelling* can facilitate this process with the functions `readList` and `writeList`, which convert a text file to an R list and vice-versa. Another function `unpackList` creates local or global variables with names that match the list components.

Table 3 illustrates a data file in PBS format, legible by `readList`. The file contains lines with an initial dollar sign (like `$x` in Table 3) that specify a list component name in R, followed by one or more lines of data. Data items are separated by white space. A single item of data corresponds to a scalar in R, multiple items on a single line correspond to a vector, and multiple lines of data correspond to a matrix with the number of columns determined by the first line of data. Thus, in Table 3, `$x` is a scalar, `$y` is a vector of length 4, and `$z` is a 2×4 matrix. The format also supports four possible data type definitions on a line preceded by `$$`:

```
$$ vector mode=numeric names=""
$$ matrix mode=numeric ncol rownames="" colnames="" byrow=TRUE
$$ data modes=numeric ncol rownames="" colnames byrow=TRUE
$$ array mode=numeric dim fromright=TRUE
```

Table 3 illustrates their use in specifying `$a`, `$b1`, and `$b2`. Matrices and data frames can be read by row or column. This choice determines the order of reading the data, and white space (including line breaks) merely signifies breaks between data items. Array objects with three or more dimensions can be read in two ways, with indices varying first from the right or from the left. For example, data for an array indexed by `[i, j, k]` are read by varying `i` first with fixed `j` and `k` if `fromright=TRUE`. Similarly, `k` varies first if `fromright=FALSE`.

As in widget descriptions, arguments may be omitted in favour of their defaults, and the `$$` line may be continued across multiple lines by using a backslash character `\`. For a `matrix`, the argument `ncol` is required. Similarly, a data object (i.e., a data frame) must specify `ncol` and a vector `colnames` of length `ncol`. Also, `modes` must have length 1 (so that all entries in the data frame have the same mode) or length `ncol`. An array must have a complete `dim` argument, a vector giving the number of dimensions for each index.

As indicated earlier, *PBS Modelling* can use this specialized data format as a convenient means of capturing data from other programs. For example, to export data from an external C program, write C code that generates a data file in PBS format, where component names in the file match the C variable names. Then read the resulting file into an R session with the function `readList`, and use `unpackList` to produce local or global R variables. At this point, both R and C share data with the same variable names. This method works well with programs written for *AD Model Builder* (<http://otter-rsch.ca/admodel.htm>), a package used extensively in fishery research and other fields. It uses reverse automatic differentiation (AD; Griewank 2000) for highly efficient calculation of maximum likelihood estimates.

To considerable extent, R has native support for reading and writing a variety of text files, including the functions `scan`, `cat`, `source`, `dump`, `dget`, `dput`, `read`, `write`, `read.table`, and `write.table`. External programs sometimes utilize R formats for their input data. For example, the program *WinBUGS* (Speigelhalter et al., 2004), which implements Bayesian inference using Gibbs sampling, uses data files written in a list format closely related to the R syntax produced by the `dput` function. If the file `myData.txt` has `dput` format, then either of the two R commands

```
myData <- dget("myData.txt");  
myData <- eval(parse("myData.txt"));
```

produces a corresponding R list object named `myData`.

We should, however, add a word of caution here. When R saves array data in `dput` format, it converts the array to a vector by varying the indices from left to right. For example, a matrix with indices $[i, j]$ is saved as a vector in which i varies for each fixed j . In effect, the data are stored by column. This sometimes gives an unnatural visual appearance. In English, the eye reads naturally from left to right, then down. Matrices are normally displayed by row, with column index j varying for each fixed i . *WinBUGS*, supported by the R package *BRugs* (Thomas 2004), requires input data formatted in this visually meaningful way. More generally, *WinBUGS* reads arrays by varying the indices from right to left. The *BRugs* function `bugsData` writes data in this format, but users must take special care in reading *WinBUGS* data with the `dget` function.

4. Support functions for graphics and analysis

As mentioned in the preface, we have devised a number of functions that make it easier for us to work in R. Some of them, such as `plotBubbles`, relate to techniques discussed in our published work (e.g., Richards et al. 1997; Schnute and Haigh 2007). Others just provide convenient utilities. For example, `testCol("red")` shows all colours in the palette `colors()` that contain the string "red". We also provide support for a few analytical methods, such as function minimization. This section gives a brief description of *PBS Modelling* support functions. See the help files for further information.

4.1. Graphics utilities

`resetGraph`.....Reset various graphics parameters to defaults, with `mfrow=c(1,1)`.
`expandGraph`.....Set various graphics parameters to make graphs fill out available space.

`drawBars`Draw a linear bar plot on the current graph.
`genMatrix`.....Generate a test matrix for use in `plotBubbles`.
`plotACF`.....Plot autocorrelation bars (ACF) from a data frame, matrix, or vector.
`plotAsp`.....Plot a graph with a prescribed aspect ratio, preserving `xlim` and `ylim`.
`plotBubbles`Construct a bubble plot for a matrix.
`plotCsum`Plot cumulative sum of a vector, with value added.
`plotDens`Plot density curves from a data frame, matrix, or vector.

`plotFriedEggs`Render a pairs plot as fried eggs (density contours) and beer (correlations).
.....(Code courtesy of Dr. Steve Martell, Fisheries Science Centre, UBC.)
`plotTrace`.....Plot trace lines from a data frame, matrix, or vector.

`addArrows`Call the `arrows` function using relative (0:1) coordinates.
`addLegend`.....Add a legend using relative (0:1) coordinates.
`addLabel`Add a panel label using relative (0:1) coordinates.

`pickCol`.....Pick a colour from a complete palette and get the hexadecimal code.
`testCol`.....Display named colours available based on a set of strings.
`testLty`.....Display line types available.
`testLwd`.....Display line widths.
`testPch`.....Display plotting symbols and backslash characters.

4.2. Data management

`clearAll`Function to clear all data in the global environment.
`pad0`Pad numbers with leading zeroes (string).
`show0`.....Show decimal places including zeroes (string).
`unpackList`.....Unpack the objects in a list and make them available locally or globally.
`view`.....View the first n rows of a data frame or matrix.

4.3. Function minimization and maximum likelihood

Three functions in the `stat` package support function minimization in R: `nlm`, `nlminb`, and `optim`. These tend to perform slowly compared with other software alternatives, due partly to R's interpretive function evaluation. Nevertheless, for small problems they offer a convenient means of analysis, based entirely on code written in R. Our examples illustrate some of the possibilities. For large problems coded in other software, we still like to write independent code for a function in R, based only on the model documentation. If both versions of the software produce the same function values at selected values of the function arguments, then we have greater confidence that we have represented our model correctly in code. In that context, R serves as a valuable debugging tool.

PBS Modelling provides a support function `calcMin` that can use any method available in the `stat` package to find the vector $(\hat{x}_1, \dots, \hat{x}_n)$ of length n that minimizes the function $y = f(x_1, \dots, x_n)$. In practice, we usually apply this to the negative log likelihood for a statistical model, where the variables x_i are parameters. We define a new class `parVec`, which is a data frame with four columns:

- `val` – the actual value of parameter x_i ;
- `min` – a minimum allowable value of x_i ;
- `max` – a maximum allowable value of x_i ; and

- `active` – a logical value that determines whether or not the minimization algorithm should vary the value of x_i . If `active=F`, then x_i remains unchanged at the value `val`.

Internally, `calcMin` scales active variables x to surrogate variable s in the range $[0,1]$, where x and s are related by the inverse formulas (Schnute and Richards 1995, p. 2072):

$$x = x_{\min} + (x_{\max} - x_{\min}) \frac{1 - \cos(\pi s)}{2} = x_{\min} + (x_{\max} - x_{\min}) \sin^2 \left(\frac{\pi s}{2} \right), \quad (4.3a)$$

$$s = \frac{1}{\pi} \arccos \left(\frac{x_{\max} + x_{\min} - 2x}{x_{\max} - x_{\min}} \right) = \frac{2}{\pi} \arcsin \sqrt{\frac{x - x_{\min}}{x_{\max} - x_{\min}}}. \quad (4.3b)$$

All these formulas represent equivalent forms of a one-to-one relationship $x \leftrightarrow s$, where $x_{\min} \leq x \leq x_{\max}$ and $0 \leq s \leq 1$. Readers may find the second versions of (4.3a) and (4.3b) more intuitive (with a familiar “arc sine square root” transformation in (4.3b)), but the code uses the first versions for a possible improvement in computational efficiency by avoiding square and square root functions. The minimization algorithm works entirely with surrogate variables, which may have dimension smaller than n if some variables x_i are not active. The function `scalePar` scales an object x of class `parVec` x to a vector s of surrogates via the formula (4.3b). Similarly, `restorePar` recovers x from s via (4.3a).

We also provide a convenient function `GT0` that restricts a numeric variable x to a positive value defined by

$$\text{GT0}(x, \varepsilon) = \begin{cases} x, & x \geq \varepsilon \\ \frac{\varepsilon}{2} \left[1 + \left(\frac{x}{\varepsilon} \right)^2 \right], & 0 < x < \varepsilon \\ \frac{\varepsilon}{2}, & x \leq 0 \end{cases} \quad (4.3c)$$

The notation `GT0` denotes “greater than zero”. This function preserves the value of x if $x \geq \varepsilon$, and for smaller values x it is always true that $\text{GT0}(x, \varepsilon) \geq \frac{\varepsilon}{2}$. The function (4.3c) also has a continuous first derivative that makes sense locally on a small scale of size ε . This property makes it useful for avoiding unrealistic numbers that might be negative or zero, particularly when the minimization algorithm uses derivatives of the objective function.

In summary, *PBS Modelling* has four functions that facilitate function minimization.

`calcMin`.....Calculate the minimum of a user-defined function.

`scalePar`Scale parameters to surrogates in the range $[0,1]$.

restorePar.....Restore actual parameters from surrogate values.
GT0Restrict a numeric variable to a positive value (“Greater Than 0”).

4.4. Handy utilities

calcFib.....Calculate Fibonacci numbers (included only to illustrate the use of C code).
calcGM.....Calculate the geometric mean of a vector of numbers.
findPat.....Find all strings that include any string in a vector of patterns.
getYesPrompt the user with a GUI to choose yes or no.
isWhatIdentify an object by its class and attributes
pause.....Pause, typically between graphics displays.
showAlertDisplay a message in an alert window.
showArgsShow the arguments for a specified widget in Appendix A.
showHelpDisplay the Help Page for specified packages installed on user’s system.
testWidgetsGUI to test all widgets listed in Appendix A.
view.....View the first/last/random n lines of a (potentially large) object.

5. Functions for project management

A project to design and write software typically involves keeping track of numerous component files that contain material at various stages of progress. Some contain input, such as source code, data, or documentation. Others contain various stages of output, such as compiled code, processed documents, graphs, and other analytic results. Specialized software, such as C compilers, text processors (like TeX), database utilities, and R itself play a role in converting the input to the output. Along the way, intermediate files often get created that ultimately need to be removed to give a clean result. GUI tools in *PBS Modelling* can assist a user in managing such projects.

For simplicity, we envisage a project as a collection of files in the current working directory that typically share a common prefix but also have various possible extensions, such as .c, .h, .o, .so, .dll, and .exe. We provide a GUI that illustrates a special case of project management. It allows a user to create and compile a C function, load it into R, run it, and compare the results with a similar function coded entirely in R. See the companion functions:

loadC.....Launch a GUI for compiling and loading C code.
compileCCompile a C file into a shared library object.

5.1. Project options

Projects commonly involve specific paths and filenames associated with applications like a C compiler. To preserve information about these settings, *PBS Modelling* allows options (including the associations with file extensions for openFile mentioned earlier) to be saved in a local file with the default name `PBSOptions.txt`. To avoid conflict with R’s `options()`,

we use the hidden list `.PBSmod$.options` (mentioned in Section 2.4), and we provide the support functions:

`writePBSOptions.....`Write PBS options to an external file.
`readPBSOptions.....`Read PBS options from an external file.
`promptWriteOptions`Prompt the user to save changed options.

Options can also be set within a GUI window. This requires declaring which widgets correspond to options, as well as synchronizing (getting and setting) the current options with values shown in the window. These tasks can be accomplished with:

`declareGUIOptions.....`Declare option names that correspond with widget names.
`getGUIOptions`Get PBS options for widgets.
`setGUIOptions`Set PBS options from widget values.

Potentially, the options can exist at three levels: within a Window, within internal memory, or within a file. They become active when they exist in internal memory as part of `.PBSmod`. Our support functions allow them to be altered in GUIs and preserved in files. Different project directories can have files that specify different options. Even within a single directory, files with different names can hold different possible options.

Some options correspond to directory paths or particular files. We provide interactive GUIs that prompt for these choices with a file exploration window:

`setPathOption`Set a PBS path option interactively.
`setFileOption`Set a PBS file path option interactively.

5.2. Project management utilities

Sometimes projects have an association with an R package. For this reason, we include functions that can open files and examples from an R package installed on the user’s computer:

`openPackageFile.....`Open a file from a package subdirectory.
`openExamples.....`Open files from the `examples` subdirectory of a package.

As discussed above, a project typically includes multiple files with the same prefix and a potential set of suffixes. (A suffix doesn’t necessarily have to be a file extension. For example, you can use the prefix `foo` and the suffix `-bar.xxx` to match the file `foo-bar.xxx` where the extension is `.xxx`.) We provide a utility to open these files, provided that their extensions have associated applications. We also allow a user to search the current working directory for potential prefixes, or to browse for a working directory and find such prefixes. Furthermore, a project can be “cleaned” by removing files with specified suffixes. See the functions:

`openProjFiles`Open files with a common prefix.
`findPrefix.....`Find a prefix based on names of existing files.

setwdGUIBrowse for working directory and find prefix.
cleanProjLaunch a GUI for file deletion.

6. Support for lectures and workshops

Speakers giving lectures and workshops about R often want their audience to experience the consequences of running some R code. Sometimes participants find themselves scrambling to copy code from the visual presentation, files distributed by speaker, or related web sites. During this process, the actual intended content can get lost. Focus shifts from R concepts to typing and other mechanical issues.

PBS Modelling offers a potential solution to this problem that preserves an interactive spirit while ensuring that participants easily see the results from planned segments of R code. We encapsulate our approach in the two functions:

showResDisplay a string of R code and show results on the R console.
presentTalkPresent a talk on the R console, based on a talk description file.

The first provides a minor tool that sometimes comes in handy. The second implements a much more general idea. Just as a *window description file* defines a GUI window, a *talk description file* defines a talk that runs on the R console. The author of a talk can write a text file that contemplates a sequence of actions, such as displaying text, running R code, and opening files. If audience members receive this file in advance, they can readily follow every step during the talk. The files also give them an opportunity to review the concepts at a convenient later time. We anticipate R tutorials written as talk description files, and we may eventually add some to *PBS Modelling*.

Table 4 illustrates the format of a talk description file. It uses a mark-up style, in which tagged lines (delineated with <>) indicate starting points for description segments. Currently, `presentTalk` supports the five tags <talk>, <section>, <text>, <file>, and <code>. A single file can contain one or more talks and each talk can contain one or more sections. Possibly after initial comments (marked as usual with #), the first significant line in the file is tagged <talk>, normally followed by the start of a <section>. Lines tagged as <text> are displayed as ordinary text in the R console. These correspond to lecture notes, comparable to what might otherwise appear on a slide. A <file> line indicates that one or more files should be opened at that point. For example, it might be desirable to display a file of R code or open a PowerPoint file that supplements the examples in the R console. Lines tagged as <code> are displayed and run in the R console. Appendix B gives complete details of the options available for talk description files.

Table 4. A talk description file `SwissTalk.txt` designed for use with the *PBS Modelling* function `presentTalk`. This talk examines method dispatch for the `summary` function and illustrates how it applies to the `swiss` data set, which has class `data.frame`.

File: `SwissTalk.txt`

```
<talk name="Swiss" button=FALSE>

# SECTION 1. The "summary" method
<section name="Methods" button=TRUE>

# State the talk's purpose in text
<text>
This short talk examines the "summary" method
and applies it to the "swiss" dataset.
The talk itself comes from a talk description file ...

# Show the description file
<file name="swissTalk" button=TRUE>
  swissTalk.txt

# Discuss "summary"
<text break=F>
"summary" is a function (class function):
<code break=print>
isWhat(summary) # isWhat() from PBSmodelling
<text break=F> "summary" is generic:
<code break=print> summary
<text break=F> "summary" has many methods:
<code break=print> methods(summary)

# SECTION 2. The "swiss" data
<section name="Data" button=TRUE>
<text break=F> "swiss" is a data frame (class data.frame):
<code> isWhat(swiss)
<text break=F> You can read about the data here:
<code> help(swiss) # open the help file
<text break=F> Apply "summary" to Swiss:
<code break=print> summary(swiss)
<text break=F> Print the first 3 records:
<code break=print> head(swiss,3)
<text break=F> Display the data with the "plot" method . . .
<code print=F> plot(swiss,gap=0)
<text> THE END .. THANKS FOR WATCHING!
```

Figure 5. The GUI generated by `presentTalk` from the talk description file in Table 4.

The “Swiss Talk” example in *PBS Modelling* allows a user to view the results from the short talk description file in Table 4. The first section (named “Methods”) starts by showing the description file itself (`SwissTalk.txt`), as an illustration of how `presentTalk` works. Then the audience sees aspects of R’s polymorphic function summary. The `isWhat` function (from *PBS Modelling*) shows its properties, and the `methods` function reveals the diverse ways in which `summary` has been overloaded. The second section (named “Data”) shows properties of the data frame `swiss`, as well as the consequences of applying `summary` and `plot` to this object. The talk closes with a classic message showing “THE END”.

The tag lines for `presentTalk` give the author considerable scope for introducing breaks and other features into the presentation. Furthermore, each `<talk>` block in the description file produces a corresponding GUI, similar to the one shown in Figure 5. This enables the speaker to move stepwise through the presentation, via the “GO” button. After each step, the R console remains open for additional code written on the spur of the moment. Furthermore, the menu items (Talks, Sections, Files) allow for quick movement among talks and/or sections, as well as spontaneous opening of files. For example, the speaker might choose to open and close the same file several times during a presentation. This can be programmed into the talk description or done spontaneously through the Files menu.

In addition to the automatic menu items, a user can add buttons to the GUI that accomplish similar purposes. For example, Figure 5 shows buttons that will move to the start of the sections “Methods” and “Data” or open the “swissTalk” description file. The “Back” button moves back to the previous tag segment. The blue buttons allow movement among sections – “Start” to the first section of the talk, “Prev” to the previous section, “Curr” to the start of the current section, and “Next” to the next section.

Code executed during a talk presentation potentially changes objects in the current global environment. Although the GUI allows quick jumps among talks and sections of talks, the speaker needs to remain aware of objects currently in the global environment. For example, if the first section of the talk creates objects needed by the second section, it makes no sense to skip to the second before the first has done its work. Partly for this reason, we emphasize that **`presentTalk` will allow only one talk to operate at a time. Each talk has its own GUI, named from the `<talk>` tag line.** If you use the GUI to switch from one talk to another, the

first will be terminated, the second started from the beginning, and the global environment left unchanged. In some cases, it may help to start a talk or section with `clearAll()` to ensure that previous objects in the environment don't conflict with those now being created. On the other hand, depending on the author's intent, this could be entirely the wrong thing to do.

In practice, a speaker would present his or her talk from a laptop connected to a digital projector. In this context, it is almost essential to choose large fonts in the R console. When writing a talk, it helps to view it with font sizes and R console dimensions chosen with the final presentation in mind.

7. Examples

As mentioned in the Preface, *PBS Modelling* includes a variety of examples that illustrate applications based on this and other packages. Generally, each example contains documentation, R code, a window description file, and (if required) other supporting files. All relevant files appear in the R library directory `PBSmodelling\Examples`. An example named `xxx` typically has corresponding files `xxxDoc.txt` or `xxxDoc.pdf` (documentation), `xxx.r` (R code), and `xxxWin.txt` (a window description). In the GUI for each example, buttons labelled `Docs`, `R Code`, and `Window` open these files **provided that suitable programs have been associated with the file extensions `*.txt`, `*.pdf`, and `*.r`**. In particular, a suitable program (such as the Acrobat Reader) must be installed for reading `*.pdf` files, and you may need to associate a text file editor with `*.r`. On some systems, it may be necessary to use the function `setPBSext` to define these associations, as discussed earlier in Section 2.3.

Use the function `runExamples()` to view all examples currently available in *PBS Modelling*. This procedure copies all relevant files to a temporary directory located on the path defined by the environment variable `Temp`. It then opens a window in which radio buttons allow you to select any particular case. Closing the menu window causes the temporary files and related data to be cleaned up, and returns to the initial working directory.

Alternatively, you can copy all the files from `PBSmodelling\Examples` to a directory of your choice and open R in that working directory. To run example `xxx`, type `source("xxx.r")` on the R command line. For instance, `source("LissFig.r")` creates a window (from the description file `LissFigWin.txt`) that can be used to draw the Lissajous figures described in Section 2.1. The built-in example also includes a history widget for collecting settings that the user wishes to retain.

The examples documented here illustrate only some of those available in version 1 of *PBS Modelling*. For instance, we also include a `TestFuns` GUI that we have used as a tool for debugging various functions in the package. In future versions, we plan to add more examples that illustrate important modelling concepts and provide convenient supplementary materials for university courses in fisheries, biology, ecology, statistics, and mathematics. The function `runExamples()` should always represent the complete list currently available, and the `Docs` button for each case should link to the appropriate documentation.

The nine examples presented in this section illustrate some of the possibilities available in *PBS Modelling*, although the documentation may be somewhat out of date. For example, the figures in this report may not correctly represent current versions of the GUIs and their associated graphical output. Use the `Docs` button to read the most current information for each example. If this seems rather primitive, please wait for improvements in future versions.

7.1. Random variables

7.1.1. RanVars – Random variables

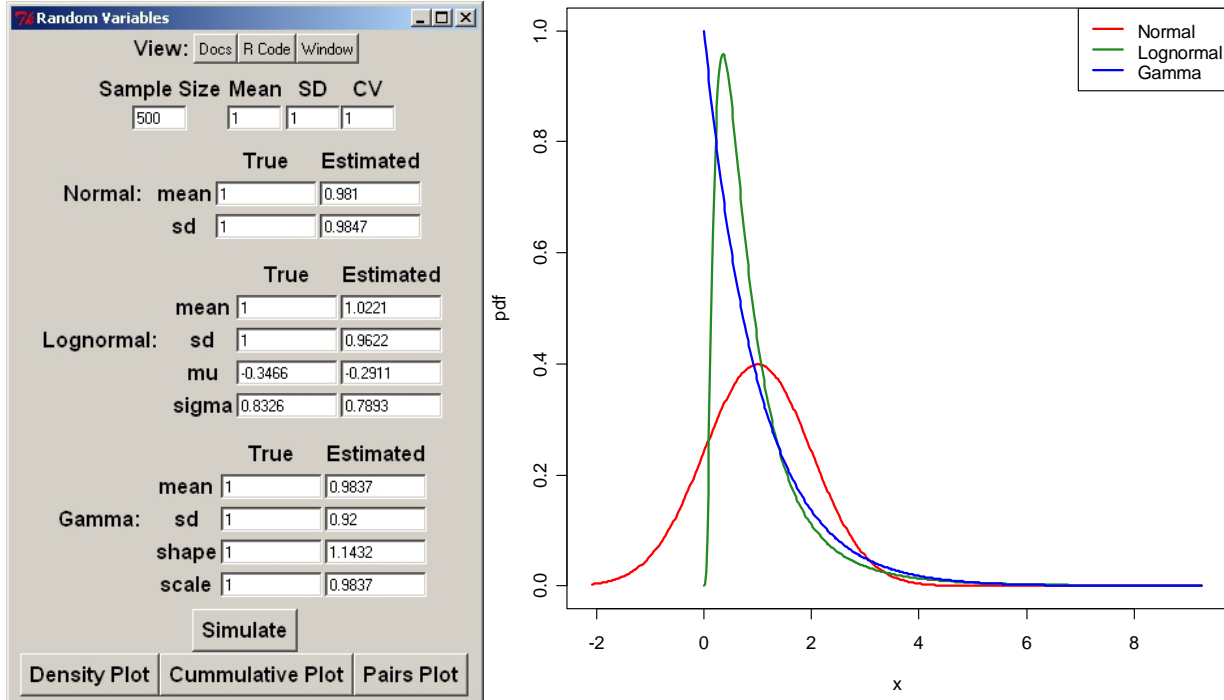

Figure 6. RanVars GUI (left) and density plot (right). Simulations are based on 500 random draws with mean = 1 and SD = 1.

The RanVars example draws samples from three continuous random distributions (normal, lognormal, and gamma) with a common mean μ and standard deviation σ . The documentation (“Docs” button) shows relevant formulas that connect distribution parameters with the moments μ and σ . Estimated parameter values from a simulation (invoked by “Simulate”) are displayed in the GUI alongside the true values (Figure 6). We use only the straightforward moment formulas in the documentation, without sample bias correction formulas like those described by Aitchison and Brown (1969). Three buttons at the bottom of the GUI portray the data visually as density curves, cumulative proportions, and paired scatter plots.

7.1.2. RanProp – Random proportions

Figure 7. RanProp GUI (left) and pairs plot (right). Simulations are based on 200 random draws where $n = 10$ for the multinomial and Dirichlet distributions and $\sigma = 0.1$ for the logistic-normal distribution. The pairs plot portrays results for the Dirichlet.

The RanProp example simulates up to five random proportions drawn from one of three distributions – multinomial, Dirichlet, and logistic-normal. The observed proportion means and standard deviations are reported in the GUI (Figure 7), and a graphical display renders the points as a paired scatter plot. After defining options in the GUI, including the vector “pvec” of true underlying proportions, press “Go”. Schnute and Haigh (2007) provide further technical details about these three distributions.

7.1.3. SineNorm – Sine normal

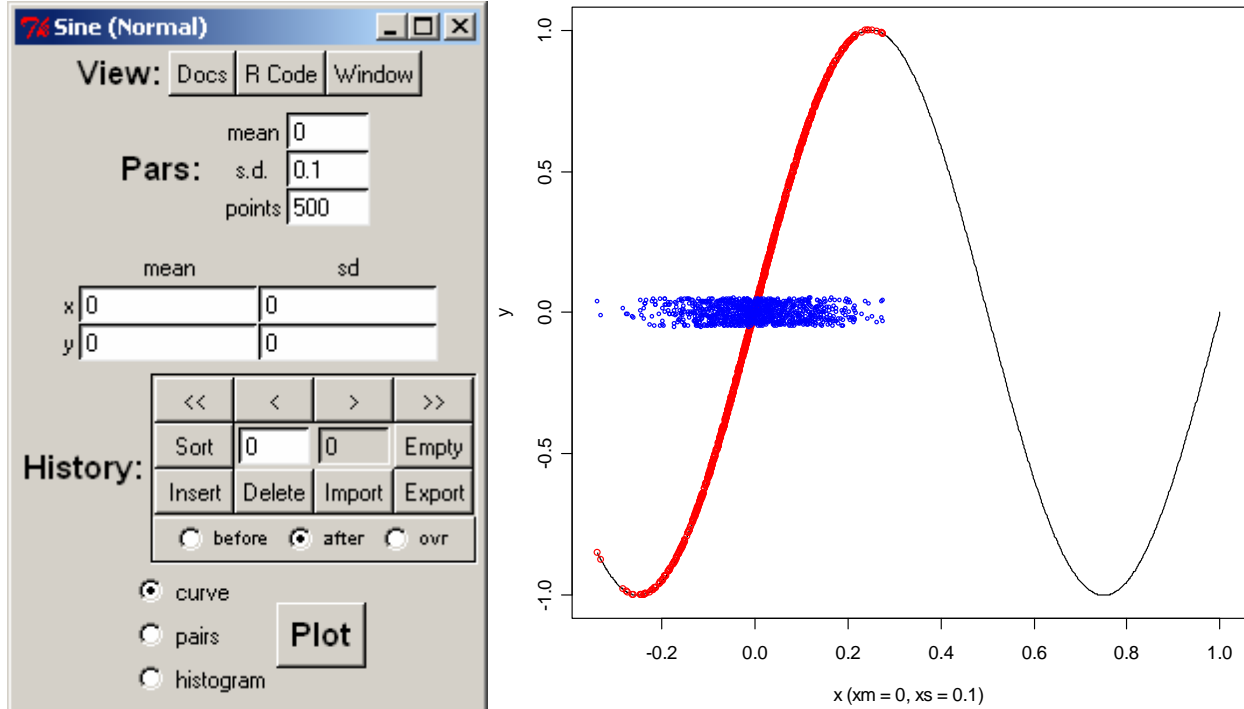

Figure 8. SineNorm GUI (left) and plot (right). Simulations are based on 500 random draws of $y = \sin(2\pi x)$, where x is normal with mean $\mu = 0$ and standard deviation $\sigma = 0.1$. Blue points portray jittered values of x , and red points show corresponding values of y .

The SineNorm example illustrates a somewhat unconventional random variable $y = \sin(2\pi x)$, where x is normal. The GUI allows you to specify the mean μ and standard deviation σ of x . If $\mu = 0$ and σ is small, the transformation is nearly linear, so that y is approximately normal. If σ is large, the transformation concentrates y near -1 and 1. Figure 8 illustrates the transformation when σ has the moderate value 0.1. Try $\sigma = 10$ to see how values y tend to occur near the peaks and troughs of the sine function, where the slope is relatively flat.

7.1.4. CalcVor – Calculate Voronoi tessellations

Figure 9. CalcVor GUI (left) and plot (right). Tessellation of random points (red) that are normally distributed on the x-axis (mean=0, sd=1) and gamma-distributed on the y-axis (shape=8, rate=2).

The CalcVor example calls *PBS Mapping*'s `calcVoronoi` function, which calculates the Voronoi (Dirichlet) tessellation for a set of points using the `deldir` function in the CRAN package *deldir*. The GUI accepts two arguments for each random distribution represented on each axis. The underlying functions and their arguments are:

Distribution	Function	Argument 1	Argument 2
Uniform	<code>runif</code>	min	max
Normal	<code>rnorm</code>	mean	sd
Gamma	<code>rgamma</code>	shape	rate
Log normal	<code>rlnorm</code>	meanlog	sdlog
Logistic	<code>rlogis</code>	location	scale
Poisson	<code>rpois</code>	lambda	---

7.2. Statistical analyses

7.2.1. LinReg – Linear regression

Figure 10. LinReg GUI (left) and regression plot (right). The linear regression uses the *cars* dataset ($n=50$) to predict *dist* vs. *speed*. The plot shows observations (green circles), fitted line (solid blue line), the 95% confidence limits of the fitted model (solid red lines), the 95% CL of the data (dashed purple lines), and the fits using the Bayes posterior estimates of (a, b) (gold lines).

The example LinReg estimates parameters in a linear regression $y = a + bx$ using either simulated data or data objects that come with the R-package. We compare a classical frequentist regression with results from Bayesian analysis, using the BRugs package to interface with the program WinBUGS. After selecting various data options, “Pairs Plot” shows a pairs plot (x, y) and “Classic Regression” adds confidence limits (at “p-level”) from regression theory. Red and violet curves show bounds for a prediction or a new observation, respectively, each conditional on x . If the data came from simulation, a blue line portrays the truth, with specified values a and b , that must be estimated from the data.

A corresponding Bayesian analysis uses the WinBUGS model shown by pressing “Model”. Choose parameters to monitor (normally all of them): the intercept a , the slope b , and the predictive standard deviation σ . After specifying a number of sample chains for the MCMC sample, press “Compile” to compile the model with these settings. “Update” generates samples in “Length” increments. Additional buttons at the bottom of the GUI allow you to explore the MCMC output. Posterior samples of (a, b) correspond to sample lines. The “Regression” button illustrates these in relationship to confidence limits from a frequentist analysis (Figure 10).

7.2.2. MarkRec – Mark-recovery

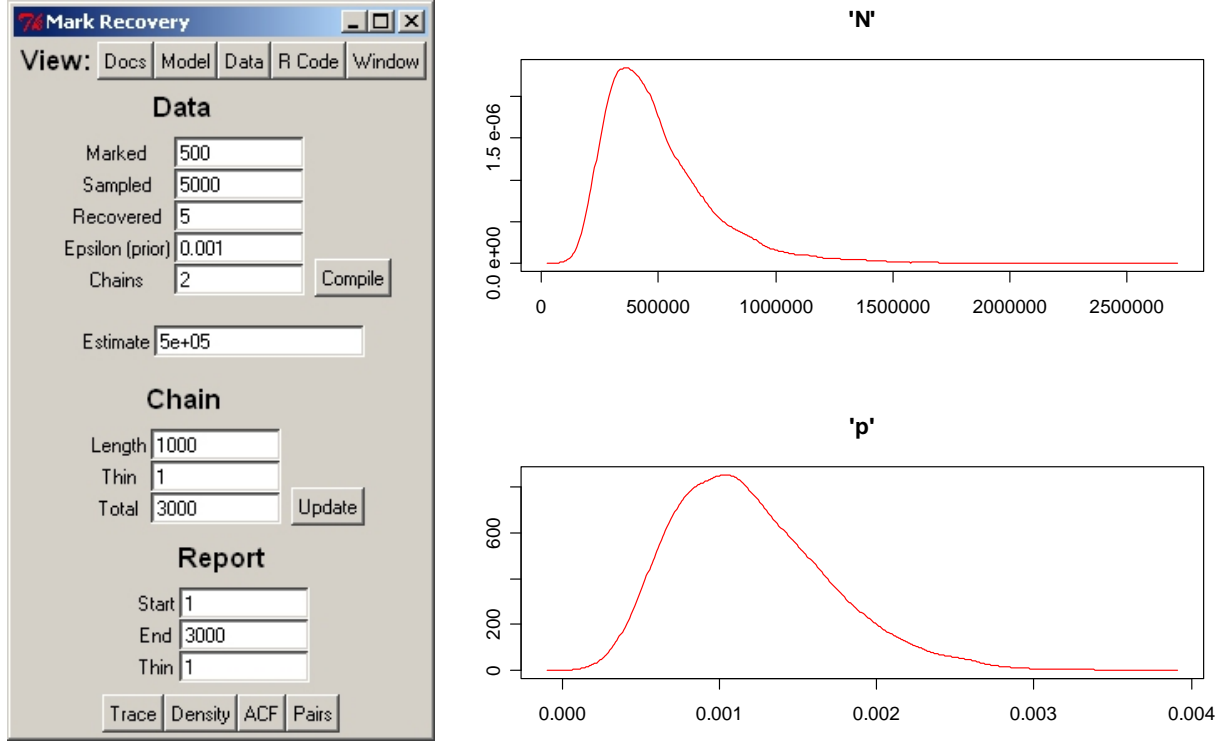

Figure 11. MarkRec GUI (left) and density plots (right). A low recovery of marked fish can lead to fat tails in N due to occasional large spikes in the population estimate.

The example MarkRec performs a Bayesian analysis of a mark-recovery experiment in which M fish are marked and allowed to disperse randomly in the population. Later, a sample of size S is removed from the population and R marks are recovered. Both the total population N and the marked proportion p are unknown, where

$$p = \frac{M}{N} \cong \frac{R}{S}.$$

In one version of the theory, R is binomially distributed with probability p in a sample of size S , and the above approximation suggests the estimate

$$\hat{N} = \frac{S}{R} M = \frac{M}{R} S.$$

When recoveries are low ($R \approx 0$), the posterior distribution of N exhibits a fat tail (Figure 11).

As in LinReg, “Model” shows the MarkRec model for WinBUGS, which (deliberately) includes an illegitimate prior that depends on the data. By increasing an initially small quantity ε , this fake prior allows the tail of N values to be arbitrarily clipped. Schnute (2006) gives some historical perspective to this analysis, in the context of work by W.E. Ricker.

7.2.3. CCA – Catch-curve analysis

Figure 12. CCA GUI (left) and parameter pairs plot (right). Comparison of Bayes posterior distribution of CCA model parameter estimates from chain 1 ($N=100$). Symbols indicate means (blue squares) and modes (red triangles). Diagonal shows parameter estimate distributions.

The example CCA illustrates a catch-curve model proposed by Schnute and Haigh (2007). It incorporates effects of survival, selectivity, and recruitment anomalies on age structure data from a single year. After making various model choices, press “Set”, “NLM” (which may take several seconds), and “Plot” to view the maximum likelihood estimates and their relationship with the data. A WinBUGS model (“Model”) allows us to calculate posterior distributions. (See the last few lines of “Model”.) As in MarkRec, select parameters to monitor, specify a number of chains, and “Compile” the model. “Update”s may be slow, but eventually they produce interesting posterior samples (Figure 12). “Docs” gives details of the deterministic model, and the Dirichlet distribution is used to describe error in the observed proportion.

We include this example to illustrate a somewhat realistic WinBUGS model that can be used to estimate parameters for a population dynamics model. Further information can be found in Schnute and Haigh (2007). *PBS Modelling* includes the data for this example as the matrix `CCA.qbr`.

7.3. Other applications

7.3.1. FishRes – Fishery reserve

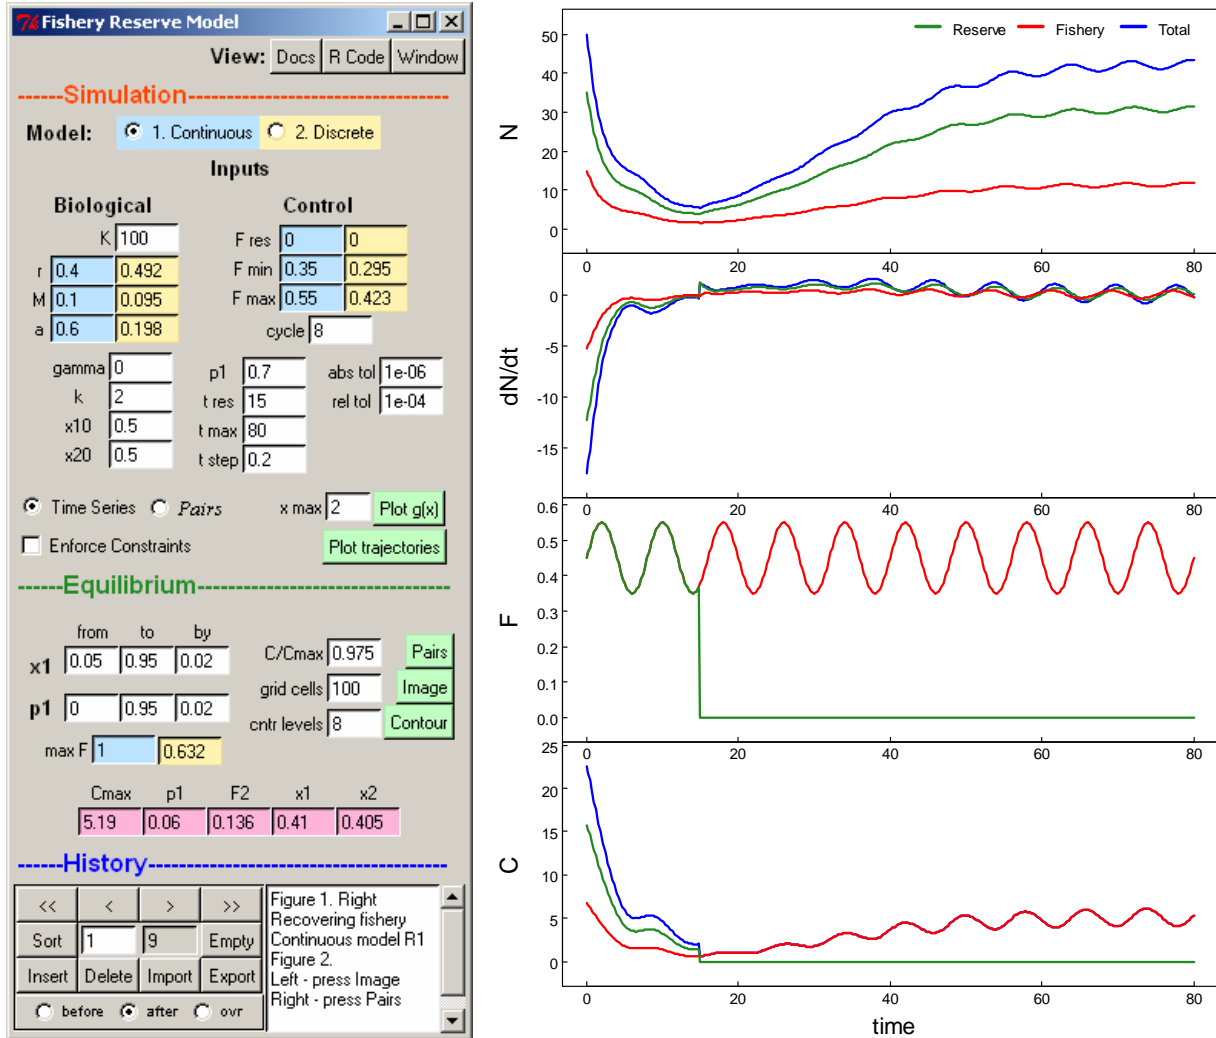

Figure 13. FishRes – Recovery of a heavily fished population after establishing a reserve. The GUI (left) shows all input values (parameters and controls). The selected continuous time model uses input values common to both models (white background) and values specific to the continuous model (blue background). Corresponding values are computed for the discrete model (yellow background). Output trajectories (right) trace various results (N = population, dN/dt = instantaneous change in population, F = instantaneous fishing mortality, C = instantaneous catch) for the reserve and fishery. Fishing mortality follows a sinusoid determined by F_{\min} , F_{\max} , and the cycle length n .

The example FishRes (Figure 13) models a fish population associated with a marine reserve in continuous or discrete time (delay differential or difference equations, respectively). For details see Schnute et al. (2007), which can be viewed by pressing the **Docs** button in the GUI. The R packages `akima`, `PBSddesolve`, and `odesolve` are required.

7.3.2. FishTows – Fishery tows

Figure 14. FishTows GUI (left) and simulated tow track (right). Tow track plots show 40 random tows in a square with side length 100. Each tow has width 2, and the rectangle encompasses 10,000 square units. *Top:* The individual rectangles, with 160 vertices, have areas that sum to 4,445 square units. *Bottom:* The union includes a complex polygon (red) and three isolated rectangles (blue, green, yellow) that cover only 3,455 square units. The complex polygon (red) has 547 vertices and 91 holes.

The example FishTows provides a simulator of fishery tow tracks using the PBSmapping package. The example demonstrates the difference between swept area and area impacted by trawls that often cover the same ground repeatedly. This application can be regarded as an exotic random number generator, where tows initially join two points picked from a uniform random distribution within a square of a given side length. Three parameters (the number of tows, the tow width, the side length) determine several random variables, including the mean tow length, the areas swept and impacted, the numbers of polygons and holes in the union set of tows, and the number of vertices in the union. Each of these would also have a variance and an overall distribution generated by many runs of this example.

Appendix A. Widget descriptions

This appendix lists *PBS Modelling* widgets in alphabetical order, except for “Window” which needs to exist before the other widgets can be placed. Details for each widget include a description, usage, arguments, and an illustrated example. In specifying a widget, the user can arrange named arguments in any order. If arguments are not named, they must appear in the order specified by the argument list, similar to named arguments in an R function.

Window

Description

Create a new window. Windows are used as a palette upon which widgets are placed. Each open window has a unique name. The function `closeWin` closes all windows unless a specific name (or vector of names) is provided by the user. Also, if `createWin` opens a window with a name already in use, the older window is closed before the new window is opened.

Usage

```
type=window name="window" title="" vertical=TRUE bg="#D4D0C8"  
fg="#000000" onclose=""
```

Arguments

name.....unique name identifying an open window
title.....text to display in the window’s title line
verticalif TRUE, arrange widgets vertically, top to bottom, within the window
bg.....background colour for window
fg.....colour for label fonts
onclose.....name of function called when user closes the window by pressing 

Example

```
window title="Widget = window (upon which all other widgets are  
placed)"
```

Button

Description

A button linked to an R function that runs a particular analysis and generates a desired output, perhaps including graphics.

Usage

```
type=button text="Calculate" font="" fg="black" bg="" width=0
function="" action="button" sticky="" padx=0 pady=0
```

Arguments

texttext to display on the button
fontfont for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
fg.....colour for label fonts
bg.....background colour for widget
width.....button width, the default 0 will adjust the width to the minimum required
functionR function to call when the button is pushed (i.e., clicked by the mouse)
actionstring value associated whenever this widget is engaged
stickyoption for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW
padx.....space used to pad the widget on the left and right
pady.....space used to pad the widget on the top and bottom

Example

```
window title="Widget = button"  
button text="Push Me"
```

Check

Description

A check box to turn a variable off or on, with corresponding values FALSE or TRUE (0 / 1).

Usage

```
type=check name mode="logical" checked=FALSE text="" font=""  
fg="black" bg="" function="" action="check" sticky="" padx=0  
pady=0
```

Arguments

namename of R variable altered by this check box (required)
modeR mode for the associated variable, where valid modes are
 logical or numeric
checked.....if TRUE, the box is checked initially and the variable is set to TRUE or 1
textidentifying text placed to the right of this check box
fontfont for labels – specify family (Times, Helvetica, or Courier),
 size (as point size), and style (bold, italic, underline,
 overstrike), in any order
fg.....colour for label fonts
bg.....background colour for widget
functionR function to call when the check box is changed
actionstring value associated whenever this widget is engaged
stickyoption for placing the widget in available space; valid choices are:
 N, NE, E, SE, S, SW, W, NW
padxspace used to pad the widget on the left and right
padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = check"  
check name=junk checked=T text="Check Me"
```

Data

Description

An aligned set of entry fields for all components of a data frame. The data widget can accept a variety of modes. The user must keep in mind that `rowlabels` and `collabels` should conform to R naming conventions (no spaces, no special characters, etc.). If mode is logical, fields appear as a set of check boxes that can be turned on or off using mouse clicks.

Usage

```
type=data nrow ncol names modes="numeric" rowlabels="" collabels=""  
rownames="X" colnames="Y" font="" fg="black" bg=""  
entryfont="" entryfg="black" entrybg="white" values=""  
byrow=TRUE function="" enter=TRUE action="data" width=6  
sticky="" padx=0 pady=0
```

Arguments

nrownumber of rows (required)
ncolnumber of columns(required)

names.....either one name or a set of `nrow*ncol` names used to store the data frame in R (required)

modes.....R modes for the data frame, where valid modes are:
numeric, integer, complex, logical, character

rowlabels.....either one label or a vector of `nrow` labels used to label rows of this data frame in the display

collabels.....either one label or a vector of `ncol` labels used to label columns of this data frame in the display

rownamesstring scalar or vector of length `nrow` to name the rows of the data frame

colnamesstring scalar or vector of length `ncol` to name the columns of the data frame

fontfont for labels – specify family (Times, Helvetica, or Courier), size (as point size), and style (bold, italic, underline, overstrike), in any order

fg.....colour for label fonts

bg.....background colour for widget

entryfontfont of entries appearing in input/output boxes

entryfg.....font colour of entries appearing in input/output boxes

entrybg.....background colour of input/output boxes

valuesdefault values (either one value for all data frame components or a set of `nrow*ncol` values)

byrow.....if TRUE and `nrow*ncol` names are used, interpret the names by row; otherwise by column. Similarly, interpret `nrow*ncol` initial values.

functionR function to call when any entry in the data frame is changed

enter.....if TRUE, call the function only after the <Enter> key is pressed

action.....string value associated whenever this widget is engaged

width.....character width to reserve for the each entry in the data frame

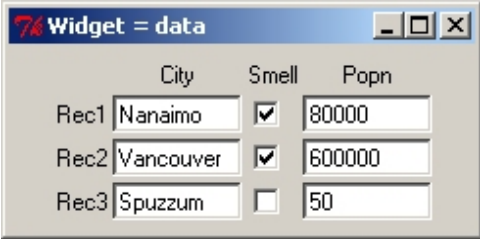

sticky.....option for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW

padx.....space used to pad the widget on the left and right

pady.....space used to pad the widget on the top and bottom

Example

```
window title="Widget = data"
data nrow=3 ncol=3 names=Census byrow=FALSE \
  modes="character logical numeric" width=10 \
  rowlabels="Rec1 Rec2 Rec3" collabels="City Smell Popn" \
  values="Nanaimo Vancouver Spuzzum T T F 80000 600000 50"
```

	City	Smell	Popn
Rec1	Nanaimo	<input checked="" type="checkbox"/>	80000
Rec2	Vancouver	<input checked="" type="checkbox"/>	600000
Rec3	Spuzzum	<input type="checkbox"/>	50

Entry

Description

A field in which a scalar variable (number or string) can be altered.

Usage

```
type=entry name value="" width=20 label="" font="" fg="" bg=""
      entryfont="" entryfg="black" entrybg="white" function=""
      enter=TRUE action="entry" mode="numeric" sticky="" padx=0
      pady=0
```

Arguments

namename of R variable corresponding to this entry (required)
valuedefault value to display in the entry
widthcharacter width to reserve for the entry
labeltext to display above the entry box
fontfont for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
fgcolour for label fonts
bgbackground colour for widget
entryfontfont of entries appearing in input/output boxes
entryfgfont colour of entries appearing in input/output boxes
entrybgbackground colour of input/output boxes
functionR function to call when the entry is changed
enterif TRUE, call the function only after the <Enter> key is pressed
actionstring value associated whenever this widget is engaged
modeR mode for the value entered, where valid modes are:
numeric, integer, complex, logical, character
stickyoption for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW
padxspace used to pad the widget on the left and right
padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = entry"  
entry name=junk value="Enter something here" width=20 mode=character
```

Grid

Description

Creates space for a rectangular block of widgets. Spaces must be filled. Widgets can be any combination of available widgets, including grid.

Usage

```
type= grid nrow=1 ncol=1 toptitle="" sidetitle="" topfont=""
      sidefont="" byrow=TRUE borderwidth=1 relief="flat" sticky=""
      padx=0 pady=0
```

Arguments

nrow.....number of rows in the grid
ncol.....number of columns in the grid
toptitletitle to place above grid
sidetitle.....title to place on the left side of the grid
topfont.....font for top labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
sidefontfont for side labels – specify family (Times, Helvetica, or
Courier), size (as point size), and style (bold, italic, underline,
overstrike), in any order
byrow.....if TRUE, create widgets across rows, otherwise down columns
borderwidth...width of the border around the grid
relieftype of border around the grid, where valid styles are:
raised, sunken, flat, ridge, groove, solid
stickyoption for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW
padx.....space used to pad the widget on the left and right
pady.....space used to pad the widget on the top and bottom

Example

```
grid 2 2 relief=groove toptitle=Columns sidetitle=Rows \
topfont="Helvetica 12 bold" sidefont="Helvetica 12 bold"
label text="Cell 1" font="times 8 italic"
label text="Cell 2" font="times 10 italic"
label text="Cell 3" font="times 12 italic"
label text="Cell 4" font="times 14 italic"
```

History

Description

Allows the user to manage a temporary archive (history) of widget settings (records) through a panel of buttons:

<<	Go directly to the first record of the history.
<	Go to the previous record in the history.
>	Go to the next record in the history.
>>	Go directly to the last record in the history.
Sort	Sort the order of the records in the history.
<i>n</i>	Display window (white background) shows the current record.
<i>N</i>	Display window (grey background) shows total number of records in the history.
Empty	Remove all records from the history.
Insert	Add a new record (current widget settings) to the history, either before, after or overtop the current record.
Delete	Remove the current record from the history.
Import	Import a previously saved history (text file) to the history, either before or after the current record.
Export	Export the history to a text file.

Usage

```
type=history name="default" function="" import="" sticky="" padx=0
pady=0
```

Arguments

namename of history archive
functionR function to call when the history record counter is changed
importfile name of a saved history to load when the widget is called
stickyoption for placing the widget in available space; valid choices are:
 N, NE, E, SE, S, SW, W, NW
padxspace used to pad the widget on the left and right
padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = history"
vector length=3 names="alpha beta gamma" values="2 5 15"
history padx=20 pady=5
```

Label

Description

Creates a text label. If the `text` argument is left blank, `label` emulates the `null` widget.

Usage

```
type= label text="" font="" fg="black" bg="" sticky="" padx=0 pady=0
```

Arguments

`text`text to display in the label
`font`font for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
`fg`colour for label fonts
`bg`background colour for widget
`sticky`option for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW
`padx`space used to pad the widget on the left and right
`pady`space used to pad the widget on the top and bottom

Example

```
window title="Widget = label"  
label text="Information Label"
```

Matrix

Description

An aligned set of entry fields for all components of a matrix. If the mode is logical, the matrix appears as a set of check boxes that can be turned on or off using mouse clicks.

Usage

```
type=matrix nrow ncol names rowlabels="" collabels="" rownames=""  
colnames="" font="" fg="black" bg="" entryfont=""  
entryfg="black" entrybg="white" values="" byrow=TRUE  
function="" enter=TRUE action="matrix" mode="numeric" width=6  
sticky="" padx=0 pady=0
```

Arguments

`nrow`number of rows (required)
`ncol`number of columns(required)

names.....either one name or a set of `nrow*ncol` names used to store the matrix in R (required)

rowlabelseither one label or a vector of `nrow` labels used to label rows of this matrix in the display

collabelseither one label or a vector of `ncol` labels used to label columns of this matrix in the display

rownamesstring scalar or vector of length `nrow` to name the rows of the matrix

colnamesstring scalar or vector of length `ncol` to name the columns of the matrix

fontfont for labels – specify family (Times, Helvetica, or Courier), size (as point size), and style (bold, italic, underline, overstrike), in any order

fg.....colour for label fonts

bg.....background colour for widget

entryfontfont of entries appearing in input/output boxes

entryfg.....font colour of entries appearing in input/output boxes

entrybg.....background colour of input/output boxes

valuesdefault values (either one value for all matrix components or a set of `nrow*ncol` values)

byrow.....if TRUE and `nrow*ncol` names are used, interpret the names by row; otherwise by column. Similarly, interpret `nrow*ncol` initial values.

functionR function to call when any entry in the matrix is changed

enter.....if TRUE, call the function only after the <Enter> key is pressed

actionstring value associated whenever this widget is engaged

modeR mode for the matrix, where valid modes are:
numeric, integer, complex, logical, character

width.....character width to reserve for the each entry in the matrix

stickyoption for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW

padx.....space used to pad the widget on the left and right

padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = matrix"
matrix nrow=2 ncol=3 rowlabels="'Row A' 'Row B'" \
      collabels="'Col 1' 'Col 2' 'Col 3'" names="a b c d e f" \
      values="10 20 30 100 200 300" font="times 10 italic"
```

Menu

Description

A menu grouping. Submenus can either be menu or menuitem.

Usage

```
type=menu nitems=1 label font=""
```

Arguments

nitemsnumber of items or submenus to include in the menu
labeltext to display as the menu label (required)
fontfont for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order

Example (assuming that the R functions have been defined)

```
window title="Widget = menu"  
menu nitems=1 label="Widgets"  
  menuitem label="Show arguments" func=showArgs  
menu nitems=4 label="Test functions"  
  menuitem label="Colours" func=testCol  
  menuitem label="Line types" func=testLty  
  menuitem label="Line widths" func=testLwd  
  menuitem label="Point symbols" func=testPch
```

MenuItem

Description

One of nitems following a menu command.

Usage

```
type=menuitem label font="" function action="menuitem"
```

Arguments

labeltext to display as the menu item label (required)

fontfont for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
functionR function to call when the menu item is clicked (required)
actionstring value associated whenever this widget is engaged

Null

Description

Creates a null widget, useful for padding a grid with blank cells that appear as empty space.

Usage

```
type=null padx=0 pady=0
```

Arguments

padxspace used to pad the label on the left and right
padyspace used to pad the label on the top and bottom

Example

```
grid 2 2 relief=raised toptitle=Top sidetitle=Side \  
topfont="Courier 10 bold" sidefont="courier 10 bold"  
label text="Here" font="courier 8"  
null  
null  
label text="There" font="courier 8"
```

Object

Description

A widget that represents the R-object specified – a vector becomes a vector widget, a matrix becomes a matrix widget, and a data frame becomes a data widget. transpose

Usage

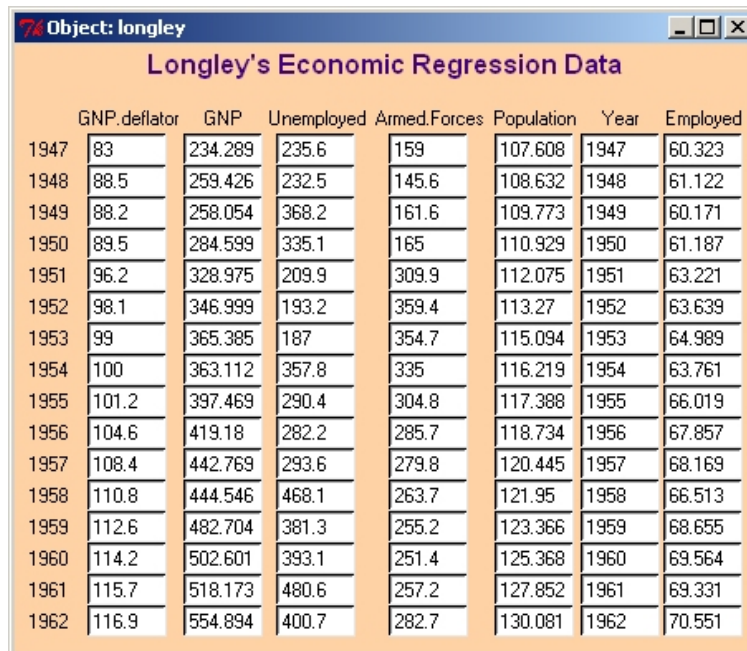

```
type=object name font="" fg="black" bg="" entryfont=""  
entryfg="black" entrybg="white" vertical=FALSE byrow=TRUE  
function="" enter=TRUE action="data" width=6 sticky="" padx=0  
pady=0
```

Arguments

namename of object (vector, matrix, or data frame) to convert to a widget
(required)
fontfont for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
fg.....colour for label fonts
bg.....background colour for widget
entryfontfont of entries appearing in input/output boxes
entryfg.....font colour of entries appearing in input/output boxes
entrybg.....background colour of input/output boxes
verticalif TRUE , display the vector as a vertical column with labels on the left;
otherwise display it as a horizontal row with labels above
functionR function to call when any entry in the vector is changed
enter.....if TRUE, call the function only after the <Enter> key is pressed
actionstring value associated whenever this widget is engaged
width.....character width to reserve for the each entry in the vector
stickyoption for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW
padx.....space used to pad the widget on the left and right
pady.....space used to pad the widget on the top and bottom

Example

```
window bg="#fffd2a6" title="Object: longley"  
label text="Longley\'s Economic Regression Data" font="bold 12" \  
fg="#400080" pady=0 sticky=S  
object name=longley width=7 pady=5
```

Radio

Description

One of a set of mutually exclusive radio buttons for making a particular choice. Buttons with the same value for name act collectively to define a single choice among the alternatives.

Usage

```
type= radio name value text="" font="" fg="black" bg="" function=""  
      action="radio" mode="numeric" sticky="" padx=0 pady=0
```

Arguments

namename of R variable altered by this radio button, where radio buttons with the same name define a mutually exclusive set (required)
valuevalue of the variable when this radio button is selected (required)
textidentifying text placed to the right of this radio button
fontfont for labels – specify family (Times, Helvetica, or Courier), size (as point size), and style (bold, italic, underline, overstrike), in any order
fgcolour for label fonts
bgbackground colour for widget
functionR function to call when this radio button is selected
actionstring value associated whenever this widget is engaged
modeR mode for the value associated with this button, where valid modes are: numeric, integer, complex, logical, character
stickyoption for placing the widget in available space; valid choices are: N, NE, E, SE, S, SW, W, NW
padxspace used to pad the widget on the left and right
padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = radio"  
grid 1 4  
  radio name=junk value=0 text="None"  
  radio name=junk value=1 text="Option A"  
  radio name=junk value=2 text="Option B"  
  radio name=junk value=3 text="Option C"
```

Slide

Description

A slide bar that sets the value of a variable. This widget only accepts integer values.

Usage

```
type= slide name from=0 to=100 value=NA showvalue=FALSE
      orientation="horizontal" font="" fg="black" bg="" function=""
      action="slide" sticky="" padx=0 pady=0
```

Arguments

namename of the numeric R variable corresponding to this slide bar (required)
fromminimum value of the variable (must be an integer)
tomaximum value of the variable (must be an integer)
valueinitial slide value, where the default is the specified from value
showvalueif TRUE, display the current slide value above the slide bar
orientation ...direction for orienting the slide bar: horizontal or vertical
fontfont for labels – specify family (Times, Helvetica, or Courier),
size (as point size), and style (bold, italic, underline,
overstrike), in any order
fgcolour for label fonts
bgbackground colour for widget
functionR function to call when the slide value is changed
actionstring value associated whenever this widget is engaged
stickyoption for placing the widget in available space; valid choices are:
N, NE, E, SE, S, SW, W, NW
padxspace used to pad the widget on the left and right
padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = slide"
slide name=junk from=1 to=1000 value=225 showvalue=T
```

SlidePlus

Description

An extended slide bar that also displays a minimum, maximum, and current value. This widget accepts real numbers.

Usage

```
type= slideplus name from=0 to=1 by=0.01 value=NA function=""  
enter=FALSE action="slideplus" sticky="" padx=0 pady=0
```

Arguments

namename of the numeric R variable corresponding to this slide bar (required)
from.....minimum value of the variable
to.....maximum value of the variable
by.....minimum amount for changing the variable's value
value.....initial slide value, where the default is the specified from value
functionR function to call when the slide value is changed
enter.....if TRUE and the slide value is changed via the entry box, call the function
 only after the <Enter> key is pressed
actionstring value associated whenever this widget is engaged
stickyoption for placing the widget in available space; valid choices are:
 N, NE, E, SE, S, SW, W, NW
padx.....space used to pad the widget on the left and right
pady.....space used to pad the widget on the top and bottom

Note

To facilitate retrieving and setting the minimum and maximum values, two additional variables are created by suffixing ".max" and ".min" to the given name.

Example

```
window title="Widget = slideplus"  
slideplus name=junk from=0 to=1 by=0.01 value=0.75
```

Text

Description

An information text box that can display messages, results, or whatever the user desires. The displayed information can be either fixed or editable.

Usage

```
type= text name height=8 width=30 edit=FALSE scrollbar=TRUE
      fg="black" bg="white" mode="character" font="" value=""
      borderwidth=1 relief="sunken" sticky="" padx=0 pady=0
```

Arguments

namename of the R variable containing the text (required)
heighttext box height
width.....text box width
editif TRUE, the user can edit the value stored in name
scrollbarif TRUE, a scroll bar is added to the right of the text box
fg.....colour for label fonts
bg.....background colour specified in hexadecimal format; e.g.,
 rgb(255 , 209 , 143 , maxColorValue=255) yields "#FFD18F"
modeR mode for the value associated with this widget, where valid modes are:
 numeric, integer, complex, logical, character
fontfont for labels – specify family (Times, Helvetica, or Courier),
 size (as point size), and style (bold, italic, underline,
 overstrike), in any order
value.....default value to display in the text
borderwidth...width of the border around the text box
relieftype of border around the text, where valid styles are:
 raised, sunken, flat, ridge, groove, solid
stickyoption for placing the widget in available space; valid choices are:
 N, NE, E, SE, S, SW, W, NW
padxspace used to pad the widget on the left and right
padyspace used to pad the widget on the top and bottom

Example

```
window title="Widget = text"
text name=mytext height=2 width=55 bg="#FFD18F" font="times 11"
      borderwidth=1 relief="sunken" edit=TRUE \
      value="You can edit text here & change value of \"mytext\""
```

Vector

Description

An aligned set of entry fields for all components of a vector. If the mode is logical, the vector appears as a set of check boxes that can be turned on or off using mouse clicks.

Usage

```
type=vector names length=0 labels="" values="" vecnames="" font=""  
  fg="black" bg="" entryfont="" entryfg="black" entrybg="white"  
  vertical=FALSE function="" enter=TRUE action="vector"  
  mode="numeric" width=6 sticky="" padx=0 pady=0
```

Arguments

names.....either one name (for a whole vector) or a vector of names for individual variables used to store the values in R (required)

length.....required only if a single name is given for a vector of length greater than 1

labelslabels for the vector display – either one label, a vector of length labels, or NULL for no labels (default " " labels with names and, if number of specified names is one, numbered elements)

valuesdefault values (either one value for all vector components or a vector of length values)

vecnamesstring vector of length length to name the scalars or vector

fontfont for labels – specify family (Times, Helvetica, or Courier), size (as point size), and style (bold, italic, underline, overstrike), in any order

fg.....colour for label fonts

bg.....background colour for widget

entryfontfont of entries appearing in input/output boxes

entryfg.....font colour of entries appearing in input/output boxes

entrybg.....background colour of input/output boxes

verticalif TRUE, display the vector as a vertical column with labels on the left; otherwise display it as a horizontal row with labels above

functionR function to call when any entry in the vector is changed

enter.....if TRUE, call the function only after the <Enter> key is pressed

actionstring value associated whenever this widget is engaged

mode.....R mode for the vector, where valid modes are:
 numeric, integer, complex, logical, character

width.....character width to reserve for the each entry in the vector

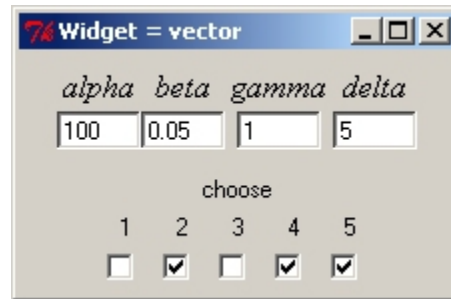

stickyoption for placing the widget in available space; valid choices are:
 N, NE, E, SE, S, SW, W, NW

padx.....space used to pad the widget on the left and right

pady.....space used to pad the widget on the top and bottom

Example

```
window title="Widget = vector"  
vector length=4 names="a b g d" labels="alpha beta gamma delta" \  
    values="100 0.05 1 5" font="times italic" width=6  
vector length=5 mode=logical names=chosen labels=choose \  
    values="F T F T T"
```

Appendix B. Talk description files

This appendix specifies the structure and syntax for talk description files discussed in Section 6. Formally, such a file contains tag lines (marked `<>`) with intervening text. We define a file *segment* as a tag line along with all the text down to (but not including) the next tag line. The last segment ends at the end of the file. Similarly, we define a *block* in the description file as a group of contiguous segments. A file contains segments of `<text>`, `R <code>`, and `<file>` names. These are combined to give `<section>` blocks, which in turn make up `<talk>` blocks. A valid file must have at least one `<talk>` line, and each `<talk>` line must be followed by at least one `<section>` line.

When `presentTalk()` calls a description file, it produces a control GUI like the one shown in Figure 5. Any declared `<talk>`s, `<section>`s, or `<file>`s automatically generate menu items in the GUI. These links can also appear as buttons within columns of the GUI’s lower section. By default, `<talk>` buttons appear in the first column, `<section>` buttons in the second column, and `<file>` buttons in the third column, although an author can overwrite these defaults. In this way, a talk description file allows an author to design both the talk’s content and the GUI used to present it. The names of menu items and buttons must always consist of alphanumeric characters and underscores. Furthermore, a name must begin with a letter.

Some tags allow the presentation to break at specified places. Specifically, a break produces a message in the R console indicating that the speaker must press the “GO” button in the GUI to continue on to the next step of the presentation. During a break, the speaker can spontaneously type code into the R console to illustrate points of immediate interest.

We end this appendix with a precise description of the purpose and syntax for each tag line. Instead of alphabetical order, we use the more logical order: `<talk>`, `<section>`, `<text>`, `<code>`, and `<file>`.

`<talk>`

Description

Starts a description block that constitutes a talk. The block ends at the next `<talk>` line or the end of the file.

Usage

```
<talk name=(required) button=FALSE col=1>
```

Arguments

nameA string giving the name of the talk (required). It appears as the title of the control GUI, a menu item (under “Talks”), and possibly also as a button.

`button`A Boolean variable (TRUE or FALSE) that determines whether or not the GUI should add a button that selects the talk, in addition to access by the menu.

`col`If a button is used, the column within which to place it in lower section of the GUI.

Notes

A file must have at least one `<talk>` line, and each `<talk>` line must be followed by at least one `<section>` line. Each `<talk>` block in a file must have a unique name.

Different talks have distinct associated control GUIs, and `presentTalk` allows *only one* presentation at a time.

<section>

Description

Starts a description block that constitutes a section of a talk. The block ends at the next `<section>` line, `<talk>` line, or the end of the file.

Usage

```
<section name=(required) button=FALSE col=2>
```

Arguments

`name`A string giving the name of the section (required). It appears in the control GUI as a menu item (under “Sections”) and possibly also as a button.

`button`A Boolean variable (TRUE or FALSE) that determines whether or not the GUI should add a button that selects the section, in addition to access by the menu.

`col`If a button is used, the column within which to place it in lower section of the GUI.

Notes

Each `<talk>` must have at least one `<section>`, and each section within a talk must have a unique name. Although a `<talk>` line is commonly followed by a `<section>` line (the first section), this may not always be true. See the description of `<file>` below.

<text>

Description

Starts a description segment that represents text to be printed on the R console.

Usage

```
<text break=TRUE>
```

Arguments

break.....A Boolean value (TRUE or FALSE) that specifies whether or not to break the presentation after displaying the text specified.

Notes

Line breaks in the description file correspond to line breaks in the displayed text. Keep lines short enough that they will fit into the R console with the large font size required for presentation (Section 6).

<file>

Description

Starts a description segment that names files to be opened by the operating system with `openFile()`.

Usage

```
<file name=(required) button=FALSE col=3 break=TRUE>
```

Arguments

name.....A string giving the name for this group of files (required). It appears in the control GUI as a menu item (under “Files”) and possibly also as a button.

button.....A Boolean variable (TRUE or FALSE) that determines whether or not the GUI should add a button that opens this group of files, in addition to the available menu item.

colIf a button is used, the column within which to place it in lower section of the GUI.

break.....A Boolean value (TRUE or FALSE) that specifies whether or not to break the presentation after opening the group of files.

Notes

File names in the description segment must appear as individual strings (separated by spaces or line breaks) that are suitable arguments for `openFile()`. Files without explicit paths are presumed to lie in the user’s working directory. As usual, the operating system must have an associated application or the *PBS Modelling* options must be set to associate extensions and applications (Sections 2.3 and 5.1 above).

Although a speaker may commonly introduce only one file at a time, it can sometimes be convenient to open several files in a single step. For example, they may all appear in a single text editor window, with tabs for selecting individual files.

If a `<file>` segment appears between `<talk>` and the talk’s first `<section>`, the file group name will be added to the talk’s GUI. However, because the segment doesn’t belong to any section, it will not cause files to be opened at this point. The feature allows files to become part of a talk without having to open them at an explicit point.

<code>

Description

Starts a description segment that represents code to be executed on the R console.

Usage

```
<code show=TRUE print=TRUE break=print>
```

Arguments

`show`.....A Boolean value (TRUE or FALSE) that specifies whether or not to show the code snippet in the R console. If shown, each line of the intended code will be prefixed by the usual R command prompt “> ”.

`print`.....A Boolean value (TRUE or FALSE) that specifies whether or not to print the results of running the R code.

`break`.....A string (show, print, all, or none) describing where to introduce breaks in the code segment:

- `show` – break only after showing the R code;
- `print` – break only after printing the results;
- `all` – break after showing the R code and again after printing the results;
- `none` – do not break during this code segment.

Notes

The text in this segment normally consists of valid R code, although a speaker may choose to demonstrate the consequences of invalid code.

Line breaks in the description file correspond to individual lines of R code. Keep lines short enough that they will fit into the R console with the large font size required for presentation, as discussed in Section 6.

Implementing a <code> segment involves a **two-step process**. First, if `show=TRUE`, the code is shown on the R console. Second, regardless of argument settings, the code is executed. If `print=TRUE`, the results are printed on the R console. Notice particularly that **code execution takes place in the second step**.

The `break` argument acts independently from the `show` and `print` arguments. For example, an author might use both `print=FALSE` and `break=print` if the R calculation takes notable time and produces extensive output that should be suppressed. In this case, the break would indicate that the calculation is complete. Similarly, the arguments `show=FALSE` and `break=show` allow an author to suppress the display of a large block of R code, but still to introduce a break before the code is executed.

Appendix C. Building PBSmodelling and other packages

The R project defines a standard for creating a package of functions, data, and documentation. You can obtain a comprehensive guide to “Writing R Extensions” (R Development Core Team 2006b, [R-exts.pdf](#)) from the CRAN web site or the R GUI (see the References above). Ligges (2003) and Ligges and Murdoch (2005) provide useful introductions. We have designed PBSmodelling and a very simple enclosed package PBStrY as prototypes for package development. This Appendix summarizes the steps needed to:

- C.1. install the required software;
- C.2. build *PBS Modelling* from source materials;
- C.3. write source materials for a new package and compile them;
- C.4. include C code in a package.

Our discussion applies only to package development on a computer running Microsoft Windows 2000, XP, or (maybe) later. We particularly highlight issues that have proved troublesome for us. The R library directory PBSmodelling\PBStools contains batch files that can assist the process. For example, you might locate this directory as C:\Utils\R\R-2.8.0\library\PBSmodelling\PBStools.

C.1. Installing required software

Building R packages requires four pieces of free software. Duncan Murdoch currently maintains their availability and installation instructions at:

<http://www.murdoch-sutherland.com/Rtools/>

Users should periodically check this website for changes to the various software packages. We recommend installing each package on a path that does *not* include spaces. For example, avoid using C:\Program Files, even if that happens to be part of a package’s default path. In this appendix, we use C:\Utils as a root directory for all required software. The list below gives a brief summary of the required software (Murdoch provides links to these products).

1. **R** itself, currently version 2.7.2 (C:\Utils\R\R-2.8.0). We assume that R is already installed from the CRAN web site <http://cran.r-project.org/> and that it runs correctly on your computer. (See ‘Upgrading to the latest version of R’ below.) We also assume that the package PBSmodelling is installed in R.
2. **Rtools installer**: Command line tools, MinGW compilers, ActivePerl text scripting, etc. (C:\Utils\Rtools\). Download and run the file Rtools28.exe. The installation should create the subdirectories \bin for command line programs, \MinGW for the minimalist GNU C compiler for Windows, and \perl for the ActivePerl scripting language. These tools are *essential*. DO NOT plan to use programs with the same name in an installation of Cygwin or any other UNIX emulator that happens to be installed on your computer.

3. The Microsoft **HTML Help Workshop** (C:\Utils\HHW\). Run the installation file `HtmlHelp.exe`. After installation, we think you can safely ignore a message that “This computer already has a newer version of HTML Help”. (If anyone has different information, please let us know.)
4. **MiKTeX**: a LaTeX and pdfTeX package (C:\Utils\MiKTeX). The link takes the user to <http://www.miktex.org/>. This processor for TeX and LaTeX files helps typeset help files within a package. Download the “basic” installation file, and install these components only. You can add more LaTeX packages from the Internet later, as required. (MiKTeX often does this automatically.) Take some time to investigate the MiKTeX package manager (`mpm.exe` or go to the “Programs” menu and select “MiKTeX 2.5”, “Browse Packages”).

We recommend enhancing MiKTeX slightly, so that it can independently process the LaTeX files produced from R documentation files.

- a) Create a new subdirectory `\R` under the MiKTeX’s directory for storing LaTeX styles and font definitions (e.g., C:\Utils\MiKTeX\tex\latex).
- b) Copy into it all files from `\texmf` in the R installation tree (e.g., C:\WinApps\R\R-2.8.0\share\texmf). These should include `Rd.sty`.
- c) Go to the “Start” menu, select “Programs” then “MiKTeX 2.5”, and run the program “Settings”. In the “General” tab, click the button marked “Refresh FNDB”. This refreshes MiKTeX’s file name database, so that it recognizes files in the new `\R` subdirectory.

Every user has a preferred editor; however, if you are still using `Notepad.exe`, you may wish to explore the freely available, open-source software called **Tinn-R** available at <http://sourceforge.net/projects/tinn-r>. **Tinn-R** is described as a “simple but efficient replacement for the basic code editor provided by Rgui”. Alternatively, the text editor **WinEdt** (available from <http://www.winedt.com/>) provides a convenient GUI for editing LaTeX files and operating MiKTeX. Combined with the R package `RWinEdt`, it can also serve as an editor and interface for R. However, it is available only as shareware that requires a fee for long-term use, unlike any other software mentioned here.

Upgrading to the latest version of R

1. Download the new R-x.y.z binary from a local CRAN mirror, such as the one at SFU: <http://cran.stat.sfu.ca/bin/windows/base/>
2. Uninstall the old version R-a.b.c (⟨Start⟩, ⟨Programs⟩, ⟨R⟩, ⟨Uninstall R-a.b.c⟩). If you cannot find an uninstall program in the ⟨Programs⟩ menu, use the Control Panel in the usual way (slightly different between Windows XP and Windows VISTA).
3. Install the new version R-x.y.z to a new folder. Our default would be:
C:\Utils\R\R-x.y.z\
4. Find the library files for both versions of R in the directories:
C:\Utils\R\R-a.b.c\library\
C:\Utils\R\R-x.y.z\library\
Copy all subdirectories (packages) from version a.b.c to version x.y.z; but press

- ⟨Shift⟩⟨No⟩ to avoid overwriting packages just installed as part of the new version. You want to copy the optional packages, but not those that come with the standard installation.
5. Run the new GUI for R-*x.y.z*. From the menu, click ⟨Packages⟩, ⟨Update packages ...⟩, select a local mirror, and wait for any installed packages to be updated. To stay current, repeat this update step every week or two.
 6. Remove the old R installation directory (*C:\Utils\R\R-a.b.c*).

At the time of writing, the program to uninstall R-*a.b.c* has a small bug, because it does not actually remove all of the packages that come with the base distribution.

PBStools for building R packages

After the above pieces of software are installed, you're ready to start building R packages. For this purpose, create a new directory (e.g., *D:\Rdevel*) that will contain your packages. Within the R library directory (*C:\Utils\R\R-2.8.0\library*), find the subdirectory *PBSmodelling\PBStools*. Copy all the batch files there into your new packages directory. You should have these 11 files:

- *RPaths.bat*, *RPathCheck.bat* related to the installation;
- *unpackPBS.bat*, *checkPBS.bat*, *buildPBS.bat*, *packPBS.bat*, related to *PBS Modelling*;
- *Runpack.bat*, *Rcheck.bat*, *Rbuild.bat*, *Rpack.bat*, *RmakePDF.bat* related to the construction of new packages.

IMPORTANT: You need to change *RPaths.bat* so that it reflects the paths you chose in the above six installations. For example, your version of this batch file might contain the lines

```
set R_PATH=C:\Utils\R\R-2.8.0\bin
set TOOLS_PATH=C:\Utils\Rtools\bin
set PERL_PATH=C:\Utils\Rtools\perl\bin
set MINGW_PATH=C:\Utils\Rtools\MinGW\bin
set TEX_PATH=C:\Utils\MiKTeX\miktex\bin
set HTMLHELP_PATH=C:\Utils\HHW
```

Notice that each path, except the last, ends in a *bin* subdirectory.

Hopefully, your installation is now complete. In your new packages directory, run *RPathCheck.bat* from a command line or double-click the icon. This script verifies that a few essential files lie on the indicated paths. If everything is correct, you should see the message “All program paths look good”. Otherwise, you’ll see a warning about software that doesn’t appear on your specified paths.

If you view all the batch files with a text editor, you will see that they don’t use your system *PATH* environment variable. Instead, each one defines a new local path appropriate for building R packages (via *RPathCheck.bat*). A *SETLOCAL* command ensures that this change doesn’t alter your system’s permanent environment.

C.2. Building PBSmodelling

Once all the required software is installed, the batch files discussed above make it fairly easy to build PBSmodelling. We assume that you have already created the directory discussed in Appendix C.1, say `D:\Rdevel`, for building R packages and that it contains the relevant eight batch files. In particular, `RPaths.bat` should reflect your installation paths and `RPathCheck.bat` should report the message that “All program paths look good”. Then follow these steps:

1. On the CRAN web site <http://cran.r-project.org/>, go to “Packages” on the left and find PBSmodelling. Download the file `PBSmodelling_x.xx.tar.gz` into `D:\Rdevel`. Then rename this file (or copy it and rename the copy) so that the version number is removed. You should now have the file `PBSmodelling.tar.gz` in `D:\Rdevel`.
2. In the development directory `D:\Rdevel`, double-click the icon for `unpackPBS.bat` or type the command `unpackPBS` in a corresponding command window. This should extract the contents of `PBSmodelling.tar.gz`, preserving directory structure, into a subdirectory `\PBSmodelling` with five subdirectories: `\data`, `\inst`, `\man`, `\R`, and `\src`.
3. Our batch file uses the command `tar -xzf PBSmodelling.tar.gz`, where `tar.exe` appears in the `\Rtools` directory (Section C.1, step 3). The command line parameters specify a verbose (`v`) extraction (`x`) of the given file (`f`), after filtering with `gzip` (`z`).

If you use other software for this extraction, please ensure that it is configured to handle UNIX files correctly. For example, “WinZip” has an option to extract a “TAR file with smart CR/LF conversion”. This must be turned off.

4. In the base directory `D:\Rdevel`, double-click the icon for `checkPBS.bat` or type the command `checkPBS` in a corresponding command window. If all software is installed correctly and `D:\Rdevel\PBSmodelling` correctly represents the contents of the `.tar.gz` file, you should see a series of DOS messages reporting “OK” to various tests. A distinct pause might accompany the message: “checking whether package 'PBSmodelling' can be installed ...”.
5. You might also encounter a delay as MiKTeX downloads the LaTeX package `lmodern`, part of a larger package `lm`. If this is really slow, you can abort the process and install `lm` with the MiKTeX package manager, as discussed in step 5 of Section C.1. Choose a remote server near you. You only need to do this once. When it’s finished, run `checkPBS.bat` again.
6. Examine the new directory `D:\Rdevel\PBSmodelling.Rcheck` created by the check process in step 2. The text files `00check.log` and `00install.out` show detailed results.

7. In the base directory `D:\Rdevel`, double-click the icon for `buildPBS.bat` or type the command `buildPBS` in a corresponding command window. This creates the file `D:\Rdevel\PBSmodelling.zip`, which could be used to install `PBSmodelling` from a local zip file.
8. Again in the base directory `D:\Rdevel`, double-click the icon for `packPBS.bat` or type the command `packPBS` in a corresponding command window. This creates a new package distribution file `PBSmodelling_x.xx.tar.gz` that replaces the one downloaded from CRAN in step 1.
9. Finally, type the command `RmakePDF PBSmodelling` in a command window for `D:\Rdevel`. This generates an indexed documentation file `PBSmodelling.pdf`. See Appendix D.3 for further details about the use of this file for producing this report.

If these steps all work without problems, you can feel confident that the requisite software is installed correctly and that you understand the basic steps needed to build R packages.

C.3. Creating a new R package

R packages require a special directory structure. The R function `package.skeleton` automatically creates this structure, but (without further work) it does not produce a package that can be compiled. Although `PBSmodelling` has the requisite structure, it is perhaps too complicated to serve as a convenient prototype. For this reason, we include a small subset `PBStr` that illustrates the key details. You can make a new package simply by editing the files in `PBStr`. You need a suitable editor (e.g., UltraEdit, WinEdt, or Notepad) to view and change various text files.

1. Start by locating the file `PBStr_x.xx.tar.gz` in the R library directory `\PBSmodelling\PBStools`. Copy this file into your development directory (`D:\Rdevel`), and rename it (or copy and rename the copy) to obtain the file `PBStr.tar.gz`.
2. Remove any previous traces of `PBStr` in your development directory, such as subdirectories `PBStr`, `PBStr.Rcheck`, and `.Rd2dvi$`, along with the documentation file `PBStr.pdf`.
3. Follow steps similar to those in Section C.2 to unpack, check, build, re-package, and document `PBStr`. You must now use a DOS command window in `D:\Rdevel` to issue the five commands
`Runpack PBStr`
`Rcheck PBStr`
`Rbuild PBStr`
`Rpack PBStr`
`RmakePDF PBStr`
which invoke the batch files `Runpack.bat`, `Rcheck.bat`, `Rbuild.bat`, `Rpack.bat` and `RmakePDF.bat`. The first command should give you a new subdirectory `\PBStr`, along with its five subdirectories: `\data`, `\inst`, `\man`, `\R`, and `\src`.

4. Use your editor to open the file `DESCRIPTION` in the root directory `\PBStrY`. This file, essential in every R package, contains key information in a special format (RDCT 2006b, Section 1.1.1). The following example illustrates a minimal set of required fields.
5.

```
Package: MyPack
Version: 1.00
Date: 2008-12-31
Title: My R Package
Author: User of PBS Modelling
Maintainer: User of PBS Modelling
Depends: R (>= 2.6.0)
Description: My customized R functions
License: GPL (>= 2)
```
6. The package name in `DESCRIPTION` must agree with the directory name in which this file lies. For example, if you change `PBStrY` to `MyPack` in `DESCRIPTION` and rename the directory from `\PBStrY` to `\MyPack`, you have effectively changed the package name. Similarly, if you change the version to `1.01`, you have effectively changed the version number that appears in the file names for distributing your package.
7. The subdirectory `\PBStrY\R` contains all R code used by the package. For example, `PBStrY` includes seven R functions (`calcFib`, `calcFib2`, `calcGM`, `calcSum`, `findPat`, `pause`, and `view`). The seven files could be combined into a single file (such as `PBStrY.R`), but we use separate files here for clarity. The functions all have relatively simple code, hopefully comprehensible to users with limited R experience. Five of them come from `PBSmodelling`. Three of them (`calcFib`, `calcFib2`, `calcSum`) call compiled C code, as we discuss more completely in Section C.4 below.
8. By convention, the distinct file `zzz.R` defines code for initializing the package. In this case the function `.First.lib`, calls `library.dynam` to load a dynamic link library (`PBStrY.dll`) created from compiled C code during the build process.
9. When a version number changes, the `DESCRIPTION` file must be changed accordingly. We also like to make a corresponding change in `zzz.R`, so that the version number appears on the R console when the library is loaded. `PBStrY` illustrates this possibility for `zzz.R`.
10. The subdirectory `\PBStrY\data` contains all data objects that come with the package. Here, the binary file `QBR.rda` holds a matrix of quillback rockfish (*Sebastes maliger*) sample data used in the CCA example above (Section 7.2.3). The same data matrix is called `CCA.qbr.h1` in `PBSmodelling`.
11. If you want to add data to a new package, first create the object (e.g., `myData`) in R and then execute the command:

```
save(myData, file="myData.rda")
```

The object name must match the prefix in the file name, and the suffix must be `.rda`. Include the resulting file in your package's `\data` subdirectory.
12. The subdirectory `\PBStrY\man` contains a documentation file for every object in the package. `PBStrY` has six functions and one data set, so the `\man` subdirectory has seven

corresponding R documentation files (`*.Rd`). An additional file `PBStry.Rd` documents the package as a whole. Rd files use a rather complex scripting language (RDCT 2006b, Section 2) that can be converted to help files in several formats (PDF, HTML, text). For many packages, the examples in `PBStry` may provide adequate prototypes. They represent three distinct cases: functions (e.g., `calcGM.Rd`, `findPat.Rd`), data sets (`QBR.Rd`), and complete packages (`PBStry.Rd`).

13. The subdirectory `\PBStry\src` contains source code for C code to be compiled into the dynamic link library `PBStry.dll`. We include sample files to calculate Fibonacci numbers iteratively (`fib.c`, `fib2.c`) and to add the components of a numeric vector (`sum.c`). In Section C.4, we discuss the linkage between R code and compiled C functions.
14. Finally, the subdirectory `\PBStry\inst` contains files that are to be included directly in the R library tree for `PBStry` when the package is installed. The file `PBStry-Info.txt` briefly describes the context and purpose of the trial package.

If you have successfully followed the steps above, you have actually built two R packages, `PBSmodelling` and `PBStry`. Furthermore, you're reasonably familiar with the contents of `PBStry`. You can use the files in that small package as prototypes for writing your own R package, which might contain R code in the subdirectory `\R`, data in `\data`, C source code in `\src`, and R documentation in `\man`.

The larger package `PBSmodelling` offers more prototypes and uses a somewhat different style. The main directory includes the required `DESCRIPTION` file, plus a second file `NAMESPACE` that lists all objects available to a user of the package. Effectively, the namespace mechanism distinguishes between objects provided by the package and other (hidden) objects required for the implementation, but not intended for public use. Our `NAMESPACE` file contains the rather cryptic instruction: `exportPattern("^[^\\.]")`. The R string `"^[^\\.]"` translates to the regular expression `^[^\\.]` that designates any pattern not starting with a period (`.`). We don't export "dot" objects, whose names in R start with a period. (For more complete information on these functions, see Appendix D.2.) The `NAMESPACE` file must also import functions required from other packages. Because `PBSmodelling` relies on `tcltk`, the file includes the command: `import(tcltk)`.

In `PBStry`, without a namespace, the file `zzz.R` defines the initializing function `.First.lib`, as mentioned in step 8 above. By contrast, the namespace protocol in `PBSmodelling` requires a different name for the initializing function: `.onLoad` in `zzz.R`.

In summary, we recommend building a new package by editing, adding, and deleting prototype files in `PBStry`. Our batch files can facilitate tests and debugging. For more advanced work, particularly packages with a namespace protocol, look at `PBSmodelling`. Have a current version of RDCT (2006b) available, and consult that manual when necessary. We find it useful to keep the PDF file open and to use Acrobat's search feature (Ctrl-F) to find topics of interest.

C.4. Embedding C code

R provides two functions, `.C()` and `.Call()`, for invoking compiled C code. `PBStr` includes two simple examples that use `.C()`, probably the method of choice for simple packages. The `.Call()` function uses a more complex interface that offers better support for R objects, and another example illustrate that calling convention.

Table C1. C representations of R data types.

R Object	C Type
logical	int *
integer	int *
double	double *
complex	Rcomplex * ¹
character	char **

¹ Rcomplex is defined in `Complex.h`.

Calling C functions from R using `.C()`

The `.C()` calling convention uses the following key concepts:

- R must allocate the appropriate length and type of variables before calling a C function.
- R objects are transformed into an equivalent C type (Table C1), and a pointer to the value is passed into the C function. All values are returned by modifying the original values passed in.
- A C function called by `.C()` must have return type `void`, because values are returned only by accessing the predefined R function arguments.
- C code written for the shared DLL must not contain a `main` function.
- Within a C function, dynamically allocated memory must be de-allocated by the programmer before the function returns. Otherwise a memory leak will likely occur.
- `.C()` returns a list similar to the `'...'` list of arguments passed in, but reflecting any changes made by the C code. (See the help file for `.C`)

Table C2. Two text files associated with a `.C()` call in `PBStry`. R code in the first file calls C code in the second.

File 1: calcFib.R

```
calcFib <- function(n, len=1) {  
  if (n<0) return(NA);  
  if (len>n) len <- n;  
  retArr <- numeric(len);  
  out <- .C("fibonacci", as.integer(n), as.integer(len),  
            as.numeric(retArr), PACKAGE="PBStry")  
  x <- out[[3]]  
  return(x) }
```

File 2: fib.c

```
void fibonacci(int *n, int *len, double *retArr) {  
  double xa=0, xb=1, xn=-1; int i,j;  
  /* iterative loop */  
  for(i=0;i<=*n;i++) {  
    /* initial conditions: fib(0)=0, fib(1)=1 */  
    if (i <= 1) { xn = i; }  
    /* fib(n) = fib(n-1) + fib(n-2) */  
    else {xn = xa + xb; xa = xb; xb = xn; }  
    /* save results if iteration i is within the  
       range from n-len to n */  
    j = i - *n + *len - 1;  
    if (j >= 0) retArr[j] = xn;  
  } /* end loop */  
} /* end function */
```

The function `calcFib` in `PBStry` illustrates an application of these concepts (Table C2). The R function uses C code to calculate the first `n` Fibonacci numbers iteratively, where a vector holds the last `len` numbers calculated. After ensuring that `n` and `len` satisfy obvious constraints, the R code creates a return array `retArr` of the appropriate length. The `.C` call passes `n`, `len`, and `retArr` by reference to the C function `fibonacci`. On exit, the vector `out` contains a list corresponding to the input variables `n`, `len`, and `retArr`, so that the third component `out[[3]]` holds the modified vector of values calculated by `fibonacci`. We encourage you also to examine a second example in `PBStry`, associated the files `calcSum.R` and `sum.c`.

Table C3. `.Call()` example adapted from `PBSty`, with two associated text files. R code in the first file calls C code in the second.

File 1: calcFib2.R

```
calcFib2 <- function(n, len=1) {  
  out <- .Call("fibonacci2", as.integer(n),  
               as.integer(len), PACKAGE="PBSty")  
  return(out) }
```

File 2: fib2.c

```
#include <R.h>  
#include <Rdefines.h>  
SEXP fibonacci2(SEXP sexp_n, SEXP sexp_len) {  
  /* ptr to output vector that we will create */  
  SEXP retVals;  
  double *p_retVals, xa=0, xb=1, xn;  
  int n, len, i, j;  
  /* convert R variables into C 'int's */  
  len = INTEGER_VALUE(sexp_len);  
  n = INTEGER_VALUE(sexp_n);  
  /* Allocate space for the output vector */  
  PROTECT(retVals = NEW_NUMERIC(len));  
  p_retVals = NUMERIC_POINTER(retVals);  
  /* iterative loop */  
  for(i=0; i<=n; i++) {  
    /* initial conditions: fib(0)=0, fib(1)=1 */  
    if (i <= 1) { xn = i; }  
    /* fib(n) = fib(n-1) + fib(n-2) */  
    else { xn = xa + xb; xa = xb; xb = xn; }  
    /* save results if iteration i is within the  
       range from n-len to n */  
    j = i - n + len - 1;  
    if (j >= 0) p_retVals[j] = xn;  
  } /* end loop */  
  UNPROTECT(1);  
  return retVals;  
} /* end fibonacci2 */
```

Calling C functions from R using `.Call()`

The `.C()` convention requires a fairly simple conversion of R objects into C types (Table C1). By contrast, `.Call()` provides extra structure that enables C to handle R objects directly (RDCT 2006b, Section 4.7). This function uses “S-expression” SEXP types defined in `rinternals.h`, a file in the `\include` directory of the R installation. An SEXP pointer can reference any type of R object. The `.Call()` convention uses the following key concepts:

- C functions called by R must accept only SEXP typed arguments. These arguments should be treated as read only.

- Similarly, C functions called by R must have SEXP return types.
- The Programmer must protect R objects from the R garbage collector, and must release protected objects before the function terminates. R provides macros for this task.
- C code written for the shared DLL must not contain a `main` function.
- Within a C function, dynamically allocated memory must be de-allocated by the programmer before the function returns. Otherwise a memory leak will likely occur.

The function `calcFib2` in Table C3 illustrates an application of these concepts. As before, the R function uses C code to calculate the first `n` Fibonacci numbers iteratively, where a vector holds the last `len` numbers calculated. (To save space, we've removed R code that checks constraints on `n` and `len`). The simple `.Call` to `fibonacci2` looks very natural. Input values `n` and `len` produce the output vector `out`, where the C code must somehow determine what `out` should be. Not surprisingly, it requires more complicated C code to make this happen.

The C function `fibonacci2` (Table C3) first loads header files that include the required definitions from R. All input and output variables belong to type `SEXP`. Other internal variables have the standard C types `double` and `int`. Functions like `INTEGER_VALUE()` convert R types into C types. The `SEXP` vector `retVals` of return values is created by the R constructor `NEW_NUMERIC()` and then protected from garbage collection by `PROTECT()`. After all required variables are defined and type cast correctly, the iterative loop of calculations follows the earlier example in Table B2. Finally, the only protected vector `retVals` is released by `UNPROTECT(1)`, and the standard closing command `return retVals` returns the output vector from `fibonacci2`.

Obviously, it takes some time and effort to become familiar with the specialized R types, constructors, and conversion functions. For this reason, it's probably easier at first to use `.C()`, rather than `.Call()`.

Appendix D. *PBS Modelling* functions and data

This appendix documents the objects currently available in *PBS Modelling*, along with a list of function dependencies for exported functions and hidden “dot” functions. The latter are hidden through R’s `NAMESPACE` but can be seen through the triple colon convention (e.g., `PBSmodelling:::.addslashes`). R also provides a function called `fixInNamespace()` for modifying `NAMESPACE` objects. The final section of this appendix details how a user can generate a standard R manual for *PBS Modelling*, that includes a Table of Contents, help pages for all objects, and an index. The manual itself is also appended.

D.1. Objects in *PBS Modelling*

<code>addArrows</code>Add arrows to a plot using relative (0:1) coordinates
<code>addHistory</code>Add current window settings to the current history record
<code>addLabel</code>Add a label to a plot using relative (0:1) coordinates
<code>addLegend</code>Add a legend to a plot using relative (0:1) coordinates
<code>backHistory</code>Move back one step in the saved values for a history widget
<code>calcFib</code>Calculate Fibonacci numbers by several methods
<code>calcGM</code>Calculate the geometric mean, allowing for zeroes
<code>calcMin</code>Calculate the minimum of user-defined function
<code>CCA.qbr</code>Data: sampled counts of quillback rockfish (<i>Sebastes maliger</i>)
<code>chooseWinVal</code>Choose and set a string item in a GUI
<code>cleanProj</code>Launch a GUI for file deletion
<code>clearAll</code>Remove all R objects from the global environment
<code>clearHistory</code>Clear saved values for a history widget
<code>clearPBSext</code>Clear file extension associations
<code>clearWinVal</code>Remove all current widget variables
<code>closeWin</code>Close GUI window(s)
<code>compileC</code>Compile a C file into a shared library object
<code>compileDescription</code>Convert and save a window description as a list
<code>createVector</code>Create a GUI with a vector widget
<code>createWin</code>Create a GUI window
<code>declareGUIoptions</code>Declare option names that correspond with widget names
<code>drawBars</code>Draw a linear barplot on the current plot
<code>expandGraph</code>Expand the plot area by adjusting margins
<code>exportHistory</code>Export a saved history
<code>findPat</code>Search a character vector to find multiple patterns
<code>findPrefix</code>Find a prefix based on names of existing files
<code>firstHistory</code>Jump to the first history record
<code>focusWin</code>Set the focus on a particular window
<code>forwHistory</code>Move forward one step in the saved values for a history widget
<code>genMatrix</code>Generate test matrices for <code>plotBubbles</code>
<code>getChoice</code>Choose one string item from a list of choices
<code>getGUIoptions</code>Get PBS options for widgets

getPBSExtGet a command associated with a filename
getPBSOptionsRetrieve a user option
getWinActRetrieve the last window action
getWinFunRetrieve names of functions referenced in a window
getWinValRetrieve widget values for use in R code
getYesPrompt the user to choose “Yes” or “No”
GT0Restrict a numeric variable to a positive value
importHistoryImport a history list from a file
initHistoryCreate structures for a new history widget
isWhatIdentify an object by its class, and attributes
jumpHistoryJump to a particular history record
lastHistoryJump to the last history record
loadCLaunch a GUI for compiling and loading C code
openExamplesOpen example files from a package
openFileOpen a file with the associated program
openPackageFileOpen a file from a package subdirectory
openProjFilesOpen files with a common prefix
pad0Pad numbers with leading zeroes
parseWinFileConvert a window description file into a list object
pausePause between graphics displays or other calculations
pickColPick a colour from a palette and get the hexadecimal code
plotACFPlot autocorrelation bars from a data frame, matrix, or vector
plotAspConstruct a plot with a specified aspect ratio
plotBubblesConstruct a bubble plot from a matrix
plotCsumPlot cumulative sum of data
plotDensPlot density curves from a data frame, matrix, or vector
plotFriedEggsRender pairs plots as fried eggs and beer
plotTracePlot trace lines from a data frame, matrix, or vector
presentTalkRun a talk in R from a talk description file
promptOpenFileDisplay an “Open File” dialogue
promptWriteOptionsPrompt the user to save changed options
promptSaveFileDisplay a “Save File” dialogue
readListRead a list from a file in *PBS Modelling* format
readPBSOptionsRead PBS options from an external file
resetGraphReset par values for a plot
restoreParGet actual parameters from scaled values
rmHistoryRemove a record from the history
runDemosRun a GUI to access demos from any R package installed
runExamplesRun GUI examples included with *PBS Modelling*
scaleParScale parameters to [0,1]
setFileOptionSet a PBS file path option interactively
setGUIOptionsSet PBS options from widget values
setPathOptionSet a PBS path option interactively

setPBSExtSet a command associated with a filename extension
setPBSoptionsSet a user option
setwdGUIBrowse for working directory and find prefix
setWinActAdd a window action to the saved action vector
setWinValUpdate widget values
show0Convert numbers into text with specified decimal places
showAlertDisplay a message in an alert window
showArgsDisplay expected widget arguments
showHelpDisplay the Help Page for specified packages installed
showResShow the results of a command represented by text
showVignettesDisplay vignettes for packages
sortHistorySort history records
testColDisplay named colours available based on a set of strings
testLtyDisplay line types available
testLwdDisplay line widths
testPchDisplay plotting symbols and backslash characters
testWidgetsDisplay sample GUIs and their source code
unpackListUnpack list elements into variables
vbdataData: Length-at-age data for a von Bertalanffy curve
vbparsData: Initial parameters for a von Bertalanffy curve
viewDisplay first *n* rows of an object
writeListWrite a list to a file in *PBS Modelling* format
writePBSoptionsWrite PBS options to an external file

Dot functions (and two list objects: `.pFormatDefs` and `.widgetDefs`)

<code>.addslashes</code>	Escape special characters from a string
<code>.autoConvertMode</code>	Convert <code>x</code> into a numeric mode
<code>.buildgrid</code>	Attach child widgets to a grid
<code>.catError</code>	Display parsing errors
<code>.catError2</code>	Display parsing error (from C code)
<code>.CGUIchooseSection</code>	Choose a section from a talk control GUI
<code>.CGUIgo</code>	Continue the execution of a talk
<code>.cleanLoadC</code>	Launch a GUI for cleaning C junk files
<code>.convertMatrixListToDataFrame</code>	Convert a list into a data frame
<code>.convertMatrixListToMatrix</code>	Convert a list to a matrix (or a higher dimensional array)
<code>.convertMode</code>	Convert a variable into a mode without showing any warnings
<code>.convertPararmStrToList</code>	Convert a string representing a widget into a vector
<code>.convertPararmStrToVector</code>	Convert a string representing data into a vector
<code>.convertVecToArray</code>	Convert a vector to an array
<code>.createTkFont</code>	Creates a usable TK font from a given string
<code>.createWidget</code>	Call the appropriate sub-function (below) to create a given widget
<code>.createWidget.button</code>	
<code>.createWidget.check</code>	
<code>.createWidget.data</code>	
<code>.createWidget.entry</code>	
<code>.createWidget.grid</code>	
<code>.createWidget.history</code>	
<code>.createWidget.label</code>	
<code>.createWidget.matrix</code>	
<code>.createWidget.null</code>	
<code>.createWidget.object</code>	
<code>.createWidget.radio</code>	
<code>.createWidget.slide</code>	
<code>.createWidget.slideplus</code>	
<code>.createWidget.text</code>	
<code>.createWidget.vector</code>	
<code>.dClose</code>	Function to execute on closing <code>runDemos()</code>
<code>.doClean</code>	Do cleaning for <code>cleanProj</code>
<code>.extractData</code>	Receive events from TK and extract data for <code>getWinAct</code>
<code>.extractFuns</code>	Extract a list of called functions
<code>.extractVar</code>	Extract values from the <code>tclvar</code> ptrs of a window
<code>.fibC</code>	Call Fibonacci C code via C
<code>.fibCall</code>	Call Fibonacci C code via <code>Call</code>
<code>.fibClosedForm</code>	Close form equation for Fibonacci numbers

<code>.fibR</code>	Calculate Fibonacci numbers in R using iteration
<code>.getArrayPts</code>	Return all possible indices of an array
<code>.getHome</code>	Get home drive (Windows) or user home (Unix)
<code>.getMatrixListSize</code>	Determine the minimum required size of the required array
<code>.getParamFromStr</code>	Convert a string representing a widget into a list including default values as defined in <code>widgetDefs.r</code>
<code>.getPrefix</code>	Get value of widget named "prefix"
<code>.guiCompileC</code>	Get parameters from GUI and call <code>compileC</code>
<code>.guiDyn</code>	Load or unload <code>lib</code> based on information from GUI
<code>.guiSource</code>	Source an R file as indicated in window description file
<code>.inCollection</code>	Find a needle in a haystack (may be removed in future)
<code>.initPBSoptions</code>	Initialization function when <code>PBSmodelling</code> is loaded
<code>.isReallyNull</code>	Test if a key exists in a list
<code>.libName</code>	Append <code>.dll</code> for Windows or <code>.so</code> for Unix
<code>.loadCRunComparison</code>	Run a comparison between R and C functions from <code>loadC</code> GUI
<code>.makeCleanVec</code>	Make descriptions of vectors for <code>cleanProj</code>
<code>.makeTCGUI</code>	Create a talk control GUI
<code>.map.add</code>	Save a new value for a given key, if no current value is set
<code>.map.get</code>	Returns a value associated with a key
<code>.map.getAll</code>	Return all values of the map
<code>.map.init</code>	Initialize the data structure that holds the map(s); a map is another name for hash table (implemented using an R list)
<code>.map.set</code>	Save a value, even if a current one exists
<code>.mapArrayToVec</code>	Determine the index to use for a vector, given the indices for an element of a higher dimensional array
<code>.matrixHelp</code>	Store an element in matrix list (or a higher dimensional array list)
<code>.mergeLists</code>	Merge two lists
<code>.mergeVectors</code>	Merge two vectors, ensuring values are unique
<code>.openFileFromGUI</code>	Open a file from a GUI
<code>.optionsNotUpdated</code>	Determine if there are uncommitted options in widget values
<code>.parsegrid</code>	Create a branch in the parse tree for children widgets of a grid
<code>.parsemenu</code>	Create a branch in the parse tree for children widgets of a menu
<code>.parseTalk</code>	Parse a talk description file
<code>.PBSdimnameHelper</code>	Add <code>dimnames</code> to an object
<code>.pFormatDefs</code>	A list defining accepted parameters (and default values) for "P" format of <code>readList</code> and <code>writeList</code>
<code>.readList.P</code>	Read a list in P format
<code>.readList.P.convertData</code>	Convert data into a proper mode
<code>.removeFromList</code>	Remove list components
<code>.runChunk</code>	Handle code, text, or file in a talk
<code>.runSection</code>	Run a section of a talk
<code>.runTalk</code>	Run a talk and launch a control GUI
<code>.searchCollection</code>	Search a haystack for a needle, or a similar longer needle

<code>.selectCleanBoxes</code>	Select checkboxes for <code>cleanProj</code>
<code>.setMatrixElement</code>	Assign values from a list into a matrix (or n dimensional array)
<code>.setWinValHelper</code>	Update widget values when <code>setWinVal</code> is called
<code>.setOption</code>	Set option for <code>setFileOption</code> or <code>setPathOption</code>
<code>.showLog</code>	Shows text in log window and/or creates log file
<code>.sortActHistory</code>	Use window action as history name
<code>.sortHelper</code>	Helper function to sort history
<code>.sortHelperActive</code>	Helper function to sort history
<code>.sortHelperFile</code>	Help history with input from and output to an archive file
<code>.stopWidget</code>	Display fatal post-parsing errors and halt
<code>.stripComments</code>	Remove comments from a string
<code>.stripExt</code>	Remove file extension from end of filename
<code>.stripSlashes</code>	Removes escape backslashes from a string
<code>.stripSlashesVec</code>	Convert a grouping of strings representing an argument into a vector of strings
<code>.trimWhiteSpace</code>	Remove leading and trailing white space
<code>.tryOpen</code>	Open file with “editor” option or alternatively, <code>openFile</code>
<code>.updateHistory</code>	Update widget values
<code>.updateFile</code>	Coordinate file transfers
<code>.validateWindowDescList</code>	Check for a valid <i>PBS Modelling</i> description list and set any missing default values
<code>.validateWindowDescWidgets</code>	Validate a single widget
<code>.viewPkgDemo</code>	Display a GUI to display something equivalent to R’s <code>demo()</code>
<code>.widgetDefs</code>	A list defining widget parameters and default values
<code>.writeList.P</code>	Saves a list to disk using the “P” format

D.2. Function dependencies

This appendix documents function dependencies within *PBS Modelling*. All functions appear as underlined entries in alphabetic order. If a function depends on others, the list of dependencies appears below the underlined name. Following a standard in UNIX and R, functions whose name begins with a period (*dot functions*) are considered hidden from the user. *PBS Modelling* enforces this standard through NAMESPACE discussed in Section C.3.

D.3. *PBS Modelling* manual

The following pages show the standard R manual for *PBS Modelling*, including help pages for all objects, a table of contents, and an index. This manual also appears on the CRAN web site:

<http://cran.r-project.org/src/contrib/Descriptions/PBSmodelling.html>

(Or from CRAN's root, locate "Packages" and find "PBSmodelling".)

To generate the pages that follow, the user should first ensure that R's style and font files have been copied to MiKTeX (see steps 5a-c in Section C.1). This enhancement is essential for the successful creation of a PDF manual.

Next we provide a choice of two methods that use the batch files `RmakePDF.bat` and `RmakePDF2.bat` to assist the user in building the manual. The first method alters a temporary TEX file *after* R's Perl script is run, and the PDF is built by calling MiKTeX commands. The second method modifies R's Perl script *before* it builds the TEX and PDF files. The final result of both methods yields a manual with letter (8.5" × 11") rather than A4 paper, and renumbering beginning on a specified page. This page number should be odd so that the next page becomes the front of a two-sided copy. Although the first method requires a redundant build of the document, it is possibly more robust to future changes in R's Perl script.

Method 1: On a command line, type the command:

```
RmakePDF PBSmodelling 79
```

which automatically generates the PDF manual `PBSmodelling.pdf` from the package's *.Rd files. Page numbering for this PDF begins with the number specified by the second argument of the above command. If the argument is not supplied, it defaults to 1.

The batch file uses R's Perl script by issuing the following command:

```
R CMD Rd2dvi --pdf --no-clean %1
```

This method creates a temporary directory called `.Rd2dvi$` containing `Rd2.tex` with the initial lines:

```
\nonstopmode{}
\documentclass[letter]{book}
\usepackage[times,hyper]{Rd}
\usepackage{makeidx}
\makeindex{}
\begin{document}
\setcounter{page}{79}
```

where a boldface red font indicates changes that `RmakePDF.bat` makes to the file `Rd2.tex`. The revised TEX file is then copied to `D:\Rdevel\PDFmodelling.tex` and the following MiKTeX commands are issued:

```
latex PBSmodelling
latex PBSmodelling
makeindex PBSmodelling
pdflatex PBSmodelling
```

(The second call to `latex` might not be needed, but it resolves a number of references. The `makeindex` command creates the table of contents.) You should now have the PDF manual called `PBSmodelling.pdf`, which can be appended to the first 78 pages of this report.

Method 2: On a command line, type the command:

```
RmakePDF2 PBSmodelling 79
```

which automatically generates the PDF manual `PBSmodelling.pdf` from the package's `*.Rd` files. Page numbering for this PDF begins with the number specified by the second argument of the above command. If the argument is not supplied, it defaults to 1.

Essentially the script in `RmakePDF2.bat` modifies R's `Rd2dvi.sh` Perl script and saves it to the file `Rd2dvi4pbs.sh`, which sits in R's `bin\` directory. The batch file then issues the command:

```
R CMD Rd2dvi4pbs.sh --pdf --no-clean %1
```

which builds and creates the manual `PBSmodelling.pdf` in the `D:\Rdevel\` directory. The batch file also retains the temporary directory `.Rd2dvi$` and copies the TEX file into the development directory. The PDF manual can be then be appended to this report (`PBSmodelling-UG.pdf`).

Once the user is satisfied with the results, he/she may wish to remove the temporary directory:

```
rm -rf .Rd2dvi$
```

The techniques presented in this appendix can be applied to any package to produce a manual based on the `*.Rd` files. Readers may wish to go further and append their manual to more detailed instructions to produce a comprehensive User's Guide such as this one.

Package ‘PBSmodelling’

October 23, 2008

Version 1.92

Date 2008-10-23

Title PBS Modelling 2.00

Author Jon T. Schnute <Jon.Schnute@dfo-mpo.gc.ca>, Alex Couture-Beil <alex@mofo.ca>, Rowan Haigh <Rowan.Haigh@dfo-mpo.gc.ca>, and Anisa Egeli <Anisa.Egeli@dfo-mpo.gc.ca>

Maintainer Jon Schnute <Jon.Schnute@dfo-mpo.gc.ca>

Depends R (>= 2.6.0)

Suggests PBSmapping, PBSddesolve, odesolve, BRugs, KernSmooth

Description PBS Modelling provides software to facilitate the design, testing, and operation of computer models. It focuses particularly on tools that make it easy to construct and edit a customized graphical user interface (GUI). Although it depends heavily on the R interface to the Tcl/Tk package, a user does not need to know Tcl/Tk. The package contains examples that illustrate models built with other R packages, including PBSmapping, odesolve, PBSddesolve, and BRugs. It also serves as a convenient prototype for building new R packages, along with instructions and batch files to facilitate that process. The R directory ‘.../library/PBSmodelling/doc’ includes a complete user guide PBSmodelling-UG.pdf. To use this package effectively, please consult the guide.

CCA.qbr

Data: Sampled Counts of Quillback Rockfish (Sebastes maliger)

Description

Count of sampled fish-at-age for quillback rockfish (*Sebastes maliger*) in Johnstone Strait, British Columbia, from 1984 to 2004.

Usage

```
data(CCA.qbr)
```

Format

A matrix with 70 rows (ages) and 14 columns (years). Attributes “syrs” and “cyrs” specify years of survey and commercial data, respectively.

[, c (3 : 5 , 9 , 13 , 14)]	Counts-at-age from research survey samples
[, c (1 , 2 , 6 : 8 , 10 : 12)]	Counts-at-age from commercial fishery samples

All elements represent sampled counts-at-age in year. Zero-value entries indicate no observations.

Details

Handline surveys for rockfish have been conducted in Johnstone Strait (British Columbia) and adjacent waterways (126°37'W to 126°53'W, 50°32'N to 50°39'N) since 1986. Yamanaka and Richards (1993) describe surveys conducted in 1986, 1987, 1988, and 1992. In 2001, the Rockfish Selective Fishery Study (Berry 2001) targeted quillback rockfish *Sebastes maliger* for experiments on improving survival after capture by hook and line gear. The resulting data subsequently have been incorporated into the survey data series. The most recent survey in 2004 essentially repeated the 1992 survey design. Fish samples from surveys have been supplemented by commercial handline fishery samples taken from a larger region (126°35'W to 127°39'W, 50°32'N to 50°59'N) in the years 1984-1985, 1989-1991, 1993, 1996, and 2000 (Schnute and Haigh 2007).

Note

Years 1994, 1997-1999, and 2002-2003 do not have data.

Examples

```
# Plot age proportions (blue bubbles = survey data, red = commercial)
data(CCA.qbr); clrs=c("cornflowerblue","orangered")
z <- CCA.qbr; cyr <- attributes(z)$cyr;
z <- apply(z,2,function(x){x/sum(x)}); z[,cyr] <- -z[,cyr];
x <- as.numeric(dimnames(z)[[2]]); xlim <- range(x) + c(-.5,.5);
y <- as.numeric(dimnames(z)[[1]]); ylim <- range(y) + c(-1,1);
expandGraph(mgp=c(2,.5,0),las=1)
plotBubbles(z,xval=x,yval=y,powr=.5,size=0.15,clrs=clrs,
  xlim=xlim,ylim=ylim,xlab="Year",ylab="Age",cex.lab=1.5)
addLegend(.5,1,bty="n",pch=1,cex=1.2,col=clrs,
  legend=c("Survey","Commercial"),horiz=TRUE,xjust=.5)
```

GT0

Restrict a Numeric Variable to a Positive Value

Description

Restrict a numeric value x to a positive value using a differentiable function. GT0 stands for “greater than zero”.

Usage

```
GT0(x,eps=1e-4)
```

Arguments

x	vector of values
eps	minimum value greater than zero.

Details

```
if (x >= eps).....GT0 = x
if (0 < x < eps).....GT0 = (eps/2) * (1 + (x/eps)^2)
if (x <= 0).....GT0 = eps/2
```

[scalePar](#), [restorePar](#), [calcMin](#)

Examples

```
plotGT0 <- function(eps=1,x1=-2,x2=10,n=1000,col="black") {
  x <- seq(x1,x2,len=n); y <- GT0(x,eps);
  lines(x,y,col=col,lwd=2); invisible(list(x=x,y=y)); }

testGT0 <- function(eps=c(7,5,3,1,.1),x1=-2,x2=10,n=1000) {
  x <- seq(x1,x2,len=n); y <- x;
  plot(x,y,type="l");
  mycol <- c("red","blue","green","brown","violet","orange","pink");
  for (i in 1:length(eps))
    plotGT0(eps=eps[i],x1=x1,x2=x2,n=n,col=mycol[i]);
  invisible(); };

testGT0()
```

PBModelling

PBS Modelling

Description

PBS Modelling provides software to facilitate the design, testing, and operation of computer models. It focuses particularly on tools that make it easy to construct and edit a customized graphical user interface (GUI). Although it depends heavily on the R interface to the Tcl/Tk package, a user does not need to know Tcl/Tk.

PBModelling contains examples that illustrate models built using other R packages, including PBMapping, odesolve, PBsddesolve, and BRugs. It also serves as a convenient prototype for building new R packages, along with instructions and batch files to facilitate that process.

The R directory `.../library/PBModelling/doc` includes a complete user guide ‘PBModelling-UG.pdf’. To use this package effectively, please consult the guide.

PBS Modelling comes packaged with interesting examples accessed through the function `runExamples()`. Additionally, users can view *PBS Modelling* widgets through the function `testWidgets()`. More generally, a user can run any available demos in his/her locally installed packages through the function `runDemos()`.

addArrows

Add Arrows to a Plot Using Relative (0:1) Coordinates

Description

Call the `arrows` function using relative (0:1) coordinates.

Usage

```
addArrows(x1, y1, x2, y2, ...)
```

Arguments

<code>x1</code>	x-coordinate (0:1) at base of arrow.
<code>y1</code>	y-coordinate (0:1) at base of arrow.
<code>x2</code>	x-coordinate (0:1) at tip of arrow.
<code>y2</code>	y-coordinate (0:1) at tip of arrow.
<code>...</code>	additional paramaters for the function <code>arrows</code> .

Details

Lines will be drawn from $(x1[i], y1[i])$ to $(x2[i], y2[i])$

See Also

[addLabel](#), [addLegend](#)

Examples

```
tt=seq(from=-5,to=5,by=0.01)
plot(sin(tt), cos(tt)*(1-sin(tt)), type="l")
addArrows(0.2,0.5,0.8,0.5)
addArrows(0.8,0.95,0.95,0.55, col="#FF0066")
```

`addLabel`

Add a Label to a Plot Using Relative (0:1) Coordinates

Description

Place a label in a plot using relative (0:1) coordinates

Usage

```
addLabel(x, y, txt, ...)
```

Arguments

<code>x</code>	x-axis coordinate in the range (0:1); can step outside.
<code>y</code>	y-axis coordinate in the range (0:1); can step outside.
<code>txt</code>	desired label at (x, y) .
<code>...</code>	additional arguments passed to the function <code>text</code> .

```
resetGraph()
addLabel(0.75, seq(from=0.9,to=0.1,by=-0.10), c('a', 'b', 'c'), col="#0033AA")
```

addLegend

*Add a Legend to a Plot Using Relative (0:1) Coordinates***Description**

Place a legend in a plot using relative (0:1) coordinates.

Usage

```
addLegend(x, y, ...)
```

Arguments

<code>x</code>	x-axis coordinate in the range (0:1); can step outside.
<code>y</code>	y-axis coordinate in the range (0:1); can step outside.
<code>...</code>	arguments used by the function <code>legend</code> , such as <code>lines</code> , <code>text</code> , or <code>rectangle</code> .

See Also

[addArrows](#), [addLabel](#)

Examples

```
resetGraph(); n <- sample(1:length(colors()),15); clr <- colors()[n]
addLegend(.2,1,fill=clr,leg=clr,cex=1.5)
```

calcFib

*Calculate Fibonacci Numbers by Several Methods***Description**

Compute Fibonacci numbers using four different methods: 1) iteratively using R code, 2) via the closed function in R code, 3) iteratively in C using the `.C` function, and 4) iteratively in C using the `.Call` function.

Usage

```
calcFib(n, len=1, method="C")
```

Arguments

<code>n</code>	nth fibonacci number to calculate
<code>len</code>	a vector of length <code>len</code> showing previous fibonacci numbers
<code>method</code>	select method to use: <code>C</code> , <code>Call</code> , <code>R</code> , <code>closed</code>

Value

Vector of the last `len` Fibonacci numbers calculated.

calcGM

Calculate the Geometric Mean, Allowing for Zeroes

Description

Calculate the geometric mean of a numeric vector, possibly excluding zeroes and/or adding an offset to compensate for zero values.

Usage

```
calcGM(x, offset = 0, exzero = TRUE)
```

Arguments

x	vector of numbers
offset	value to add to all components, including zeroes
exzero	if TRUE, exclude zeroes (but still add the offset)

Value

geometric mean of the modified vector $x + \text{offset}$

Note

NA values are automatically removed from x

Examples

```
calcGM(c(0,1,100))
calcGM(c(0,1,100), offset=0.01, exzero=FALSE)
```

calcMin

Calculate the Minimum of a User-Defined Function

Description

Minimization based on the R-stat functions `nlm`, `nlminb`, and `optim`. Model parameters are scaled and can be active or not in the minimization.

Usage

```
calcMin(pvec, func, method="nlm", trace=0, maxit=1000, reltol=1e-8,
        steptol=1e-6, temp=10, repN=0, ...)
```

Arguments

<code>pvec</code>	Initial values of the model parameters to be optimized. <code>pvec</code> is a data frame comprising four columns (<code>"val"</code> , <code>"min"</code> , <code>"max"</code> , <code>"active"</code>) and as many rows as there are model parameters. The <code>"active"</code> field (logical) determines whether the parameters are estimated (T) or remain fixed (F).
<code>func</code>	The user-defined function to be minimized (or maximized). The function should return a scalar result.
<code>method</code>	The minimization method to use: one of <code>nlm</code> , <code>nlminb</code> , Nelder–Mead, BFGS, CG, L-BFGS-B, or SANN. Default is <code>nlm</code> .
<code>trace</code>	Non-negative integer. If positive, tracing information on the progress of the minimization is produced. Higher values may produce more tracing information: for method <code>"L-BFGS-B"</code> there are six levels of tracing. Default is 0.
<code>maxit</code>	The maximum number of iterations. Default is 1000.
<code>reltol</code>	Relative convergence tolerance. The algorithm stops if it is unable to reduce the value by a factor of <code>reltol*(abs(val)+reltol)</code> at a step. Default is <code>1e-8</code> .
<code>steptol</code>	A positive scalar providing the minimum allowable relative step length. Default is <code>1e-6</code> .
<code>temp</code>	Temperature controlling the <code>"SANN"</code> method. It is the starting temperature for the cooling schedule. Default is 10.
<code>repN</code>	Reports the parameter and objective function values on the R-console every <code>repN</code> evaluations. Default is 0 for no reporting.
<code>...</code>	Further arguments to be passed to the optimizing function chosen: <code>nlm</code> , <code>nlminb</code> , or <code>optim</code> . Beware of partial matching to earlier arguments.

Details

See `optim` for details on the following methods: Nelder–Mead, BFGS, CG, L-BFGS-B, and SANN.

Value

A list with components:

<code>fout</code>	The output list from the optimizer function chosen through <code>method</code> .
<code>iters</code>	Number of iterations.
<code>evals</code>	Number of evaluations.
<code>cpuTime</code>	The user CPU time to execute the minimization.
<code>elapsedTime</code>	The total elapsed time to execute the minimization.
<code>fminS</code>	The objective function value calculated at the start of the minimization.
<code>fminE</code>	The objective function value calculated at the end of the minimization.
<code>Pstart</code>	Starting values for the model parameters.
<code>Pend</code>	Final values estimated for the model parameters from the minimization.
<code>AIC</code>	Akaike's Information Criterion
<code>message</code>	Convergence message from the minimization routine.

Note

Some arguments to `calcMin` have no effect depending on the `method` chosen.

In the stats package: [nlm](#), [nlminb](#), and [optim](#).

Examples

```
Ufun <- function(P) {
  Linf <- P[1]; K <- P[2]; t0 <- P[3]; obs <- afile$len;
  pred <- Linf * (1 - exp(-K*(afile$age-t0)));
  n <- length(obs); ssq <- sum((obs-pred)^2 );
  return(n*log(ssq)); };
afile <- data.frame(age=1:16, len=c(7.36,14.3,21.8,27.6,31.5,35.3,39,
  41.1,43.8,45.1,47.4,48.9,50.1,51.7,51.7,54.1));
pvec <- data.frame(val=c(70,0.5,0), min=c(40,0.01,-2), max=c(100,2,2),
  active=c(TRUE,TRUE,TRUE), row.names=c("Linf", "K", "t0"),
  stringsAsFactors=FALSE);
alist <- calcMin(pvec=pvec, func=Ufun, method="nlm", steptol=1e-4, repN=10);
print(alist[-1]); P <- alist$Pend;
resetGraph(); expandGraph();
xnew <- seq(afile$age[1], afile$age[nrow(afile)], len=100);
ynew <- P[1] * (1 - exp(-P[2]*(xnew-P[3]))) );
plot(afile); lines(xnew, ynew, col="red", lwd=2);
addLabel(.05, .88, paste(paste(c("Linf", "K", "t0"), round(P, c(2,4,4))),
  sep=" = "), collapse="\n"), adj=0, cex=0.9);
```

chooseWinVal

Choose and Set a String Item in a GUI

Description

Prompts the user to choose one string item from a list of choices displayed in a GUI, then sets a specified variable in a target GUI.

Usage

```
chooseWinVal(choice, varname, winname="window")
```

Arguments

choice	vector of strings from which to choose
varname	variable name to which choice is assigned in the target GUI
winname	window name for the target GUI

Details

chooseWinVal activates a setWinVal command through an onClose function created by the getChoice command and modified by chooseWinVal.

Value

No value is returned directly. The choice is written to the PBS options workspace, accessible through `getPBSoptions("getChoice")`. Also set in PBS options is the window name from which the choice was activated.

Note

Microsoft Windows users may experience difficulties switching focus between the R console and GUI windows. The latter frequently disappear from the screen and need to be reselected (either clicking on the task bar or pressing <Alt><Tab>. This issue can be resolved by switching from MDI to SDI mode. From the R console menu bar, select <Edit> and <GUI preferences>, then change the value of “single or multiple windows” to SDI.

```

```
createWin(wlist,astext=T); test();
## End(Not run)
```

cleanProj

Launch a GUI for File Deletion

Description

Launches a new window which contains an interface for deleting junk files from the working directory.

Usage

```
cleanProj(prefix, suffix, files)
```

Arguments

prefix	default prefix for file names.
suffix	character vector of suffixes used for clean options.
files	character vector of file names used for clean options.

Details

All arguments may contain wildcard characters ("*" to match 0 or more characters, "?" to match any single character).

The GUI includes the following:

- 1 An entry box for the prefix.
The default value of this entry box is taken from `prefix`.
- 2 Check boxes for each suffix in the `suffix` argument and for each file name in the `files` argument.
- 3 Buttons marked "Select All" and "Select None" for selecting and clearing all the check boxes, respectively.
- 4 A "Clean" button that deletes files in the working directory matching one of the following criteria:
 - (i) file name matches both an expansion of a concatenation of a prefix in the entry box and a suffix chosen with a check box; or
 - (ii) file name matches an expansion of a file chosen with a check box.

Examples

```
## Not run:
cleanProj(prefix="foo", suffix=c(".a*", ".b?", ".c", "-old.d"), files=c("red", "blue"))
## End(Not run)
```

clearAll

Remove all R Objects From the Global Environment

Description

Generic function to clear all objects from .RData in R

Usage

```
clearAll(hidden=TRUE, verbose=TRUE, PBSSave=TRUE)
```

Arguments

`hidden` if TRUE, remove variables that start with a dot(.).
`verbose` if TRUE, report all removed items.
`PBSSave` if TRUE, do not remove .PBSmod.

clearPBSext	<i>Clear File Extension Associations</i>
-------------	------------------------------------------

Description

Disassociate any number of file extensions from commands previously saved with `setPBSext`.

Usage

```
clearPBSext(ext)
```

Arguments

`ext` optional character vector of file extensions to clear; if unspecified, all associations are removed

See Also

[setPBSext](#), [getPBSext](#), [openFile](#)

clearWinVal	<i>Remove all Current Widget Variables</i>
-------------	--------------------------------------------

Description

Remove all global variables that share a name in common with any widget variable name defined in `names(getWinVal())`. Use this function with caution.

Usage

```
clearWinVal()
```

See Also

[getWinVal](#)

closeWin	<i>Close GUI Window(s)</i>
----------	----------------------------

Description

Close (destroy) one or more windows made with `createWin`.

Usage

```
closeWin(name)
```

Arguments

name	a vector of window names that indicate which windows to close. These names appear in the <i>window description file(s)</i> on the line(s) defining WINDOW widgets. If name is omitted, all active windows will be closed.
------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

See Also

[createWin](#)

compileC	<i>Compile a C File into a Shared Library Object</i>
----------	------------------------------------------------------

Description

This function provides an alternative to using R's SHLIB command to compile C code into a shared library object.

Usage

```
compileC(file, lib="", options="", logWindow=TRUE, logFile=TRUE)
```

Arguments

file	name of the file to compile.
lib	name of shared library object (without extension).
options	linker options (in one string) to prepend to a compilation command.
logWindow	if TRUE, a log window containing the compiler output will be displayed.
logFile	if TRUE, a log file containing the compiler output will be created.

Details

If `lib=""`, it will take the same name as `file` (with a different extension).

If an object with the same name has already been dynamically loaded in R, it will be unloaded automatically for recompilation.

The name of the log file, if created, uses the string value from `lib` concatenated with `".log"`.

See Also

[loadC](#)

Examples

```
## Not run:
compileC("myFile.c", lib="myLib", options="myObj.o")
## End(Not run)
```

compileDescription *Convert and Save a Window Description as a List*

Description

Convert a *window description file* (ASCII markup file) to an equivalent *window description list*. The output list (an ASCII file containing R-source code) is complete, i.e., all default values have been added.

Usage

```
compileDescription(descFile, outFile)
```

Arguments

descFile name of *window description file* (markup file).
 outFile name of output file containing R source code.

Details

The *window description file* descFile is converted to a list, which is then converted to R code, and saved to outFile.

See Also

[parseWinFile](#), [createWin](#)

createVector *Create a GUI with a Vector Widget*

Description

Create a basic window containing a vector and a submit button. This provides a quick way to create a window without the need for a *window description file*.

Usage

```
createVector(vec, vectorLabels=NULL, func="",
             windowname="vectorwindow")
```

Arguments

vec a vector of strings representing widget variables. The values in vec become the default values for the widget. If vec is named, the names are used as the variable names.
 vectorLabels an optional vector of strings to use as labels above each widget.
 func string name of function to call when new data are entered in widget boxes or when "GO" is pressed.
 windowname unique window name, required if multiple vector windows are created.

See Also

`createWin`

Examples

```
## Not run:
#user defined function which is called on new data
drawLiss <- function() {
  getWinVal(scope="L");
  tt <- 2*pi*(0:k)/k; x <- sin(2*pi*m*tt); y <- sin(2*pi*(n*tt+phi));
  plot(x,y,type="p"); invisible(NULL); };

#create the vector window
createVector(c(m=2, n=3, phi=0, k=1000),
  vectorLabels=c("x cycles", "y cycles", "y phase", "points"),
  func="drawLiss");
## End(Not run)
```

createWin

Create a GUI Window

Description

Create a GUI window with widgets using instructions from a Window Description (markup) File.

Usage

```
createWin(fname, astext=FALSE)
```

Arguments

<code>fname</code>	name of <i>window description file</i> or list returned from <code>parseWinFile</code> .
<code>astext</code>	logical: if TRUE, interpret <code>fname</code> as a vector of strings with each element representing a line in a <i>window description file</i> .

Details

Generally, the markup file contains a single widget per line. However, widgets can span multiple lines by including a backslash ('\') character at the end of a line, prompting the suppression of the newline character.

For more details on widget types and markup file, see “PBSModelling-UG.pdf” in the R directory `.../library/PBSmodelling/doc`.

It is possible to use a Window Description List produced by `compileDescription` rather than a file name for `fname`.

Another alternative is to pass a vector of characters to `fname` and set `astext=T`. This vector represents the file contents where each element is equivalent to a new line in the *window description file*.

Note

Microsoft Windows users may experience difficulties switching focus between the R console and GUI windows. The latter frequently disappear from the screen and need to be reselected (either clicking on the task bar or pressing <Alt><Tab>. This issue can be resolved by switching from MDI to SDI mode. From the R console menu bar, select <Edit> and <GUI preferences>, then change the value of “single or multiple windows” to SDI.

```
## Not run:
# See file ../library/PBSmodelling/testWidgets/LissWin.txt

# Calculate and draw the Lissajous figure
drawLiss <- function() {
  getWinVal(scope="L"); ti=2*pi*(0:k)/k;
  x=sin(2*pi*m*ti); y=sin(2*pi*(n*ti+phi));
  plot(x,y,type=ptype); invisible(NULL); };
createWin(system.file("testWidgets/LissWin.txt",package="PBSmodelling"));
## End(Not run)
```

`declareGUIOptions` *Declare Option Names that Correspond with Widget Names*

Description

This function allows a GUI creator to specify widget names that correspond to names in PBS options. These widgets can then be used to load and set PBS options using `getGUIOptions` and `setGUIOptions`.

Usage

```
declareGUIOptions(newOptions)
```

Arguments

`newOptions` a character vector of option names

Details

`declareGUIOptions` is typically called in a GUI initialization function. The option names are remembered and used for the functions `getGUIOptions`, `setGUIOptions`, and `promptSave`.

See Also

[getGUIOptions](#), [setGUIOptions](#), [promptWriteOptions](#)

Examples

```
## Not run:
declareGUIOptions("editor")
## End(Not run)
```

drawBars

Draw a Linear Barplot on the Current Plot

Description

Draw a linear barplot on the current plot.

Usage

```
drawBars(x, y, width, base = 0, ...)
```

Arguments

x	x-coordinates
y	y-coordinates
width	bar width, computed if missing
base	y-value of the base of each bar
...	further graphical parameters (see <code>par</code>) may also be supplied as arguments

Examples

```
plot(0:10, 0:10, type="n")
drawBars(x=1:9, y=9:1, col="deepskyblue4", lwd=3)
```

expandGraph

Expand the Plot Area by Adjusting Margins

Description

Optimize the plotting region(s) by minimizing margins.

Usage

```
expandGraph(mar=c(4, 3, 1.2, 0.5), mgp=c(1.6, .5, 0), ...)
```

Arguments

mar	numerical vector of the form 'c(bottom, left, top, right)' specifying the margins of the plot
mgp	numerical vector of the form 'c(axis title, axis labels, axis line)' specifying the margins for axis title, axis labels, and axis line
...	additional graphical parameters to be passed to <code>par</code>

See Also

[resetGraph](#)

Examples

```

resetGraph(); expandGraph(mfrow=c(2,1));
tt=seq(from=-10, to=10, by=0.05);

plot(tt,sin(tt), xlab="this is the x label", ylab="this is the y label",
      main="main title", sub="sometimes there is a \"sub\" title")
plot(cos(tt),sin(tt*2), xlab="cos(t)", ylab="sin(2 t)", main="main title",
      sub="sometimes there is a \"sub\" title")

```

exportHistory

*Export a Saved History***Description**

Export the current history list.

Usage

```
exportHistory(hisname="", fname="")
```

Arguments

hisname	name of the history list to export. If set to "", the value from <code>getWinAct()[1]</code> will be used instead.
fname	file name where history will be saved. If it is set to "", a <Save As> window will be displayed.

See Also

[importHistory](#), [initHistory](#), [promptSaveFile](#)

findPat

*Search a Character Vector to Find Multiple Patterns***Description**

Use all available patterns in `pat` to search in `vec`, and return the matched elements in `vec`.

Usage

```
findPat(pat, vec)
```

Arguments

pat	character vector of patterns to match in <code>vec</code>
vec	character vector where matches are sought

Value

A character vector of all matched strings.

Examples

```

#find all strings with a vowel, or that start with a number
findPat(c("[aeoiy]", "^[0-9]"), c("hello", "WRLD", "11b"))

```

findPrefix

Find a Prefix Based on Names of Existing Files

Description

Find the prefixes of files with a given suffix in the working directory.

Usage

```
findPrefix(suffix)
```

Arguments

suffix character vector of suffixes

Details

The function `findPrefix` locates all files in the working directory that end with one of the provided suffixes. The suffixes may contain wildcards ("`*`" to match 0 or more characters, "?" to match any single character).

If `findPrefix` was called from a widget as specified in a *window description file*, then the value of a widget named `prefix` will be set to the prefix of the first matching file found, with an exception: if the value of the `prefix` widget matches one of the file prefixes found, it will not be changed.

To use this function in a *window description file*, the action of the widget is used to specify the suffixes to match, with the suffixes separated by commas. For example, `action=.c, .cpp` would set a `prefix` widget to the first file found with an extension `.c` or `.cpp`.

Value

A character vector of all the prefixes of files in the working directory that matched to one of the given suffixes.

See Also

[setwdGUI](#)

Examples

```
## Not run:
# Match files that end with '.a' followed by 0 or more characters,
# '.b' followed by any single character, '.c', or '-old.d'
# (a suffix does not have to be a file extension)
findPrefix(".a*", ".b?", ".c", "-old.d")
## End(Not run)
```

focusWin

*Set the Focus on a Particular Window***Description**

Bring the specified window into focus, and set it as the active window. `focusWin` will fail to bring the window into focus if it is called from the R console, since the R console returns focus to itself once a function returns. However, it will work if `focusWin` is called as a result of calling a function from the GUI window. (i.e., pushing a button or any other widget that has a function argument).

Usage

```
focusWin(winName, winVal=TRUE)
```

Arguments

<code>winName</code>	name of window to focus
<code>winVal</code>	if TRUE, associate <code>winName</code> with the default window for <code>setWinVal</code> and <code>getWinVal</code>

Examples

```
## Not run:
focus <- function() {
  winName <- getWinVal()$select;
  focusWin(winName);
  cat("calling focusWin(\"", winName, "\")\n", sep="");
  cat("getWinVal()$myvar = ", getWinVal()$myvar, "\n\n", sep=""); };

#create three windows named win1, win2, win3
#each having three radio buttons, which are used to change the focus
for(i in 1:3) {
  winDesc <- c(
    paste('window name=win',i,' title="Win',i,'" ', sep=''),
    paste('entry myvar ', i, sep=''),
    'radio name=select value=win1 text="one" function=focus mode=character',
    'radio name=select value=win2 text="two" function=focus mode=character',
    'radio name=select value=win3 text="three" function=focus mode=character');
  createWin(winDesc, astatic=TRUE); };
## End(Not run)
```

genMatrix

*Generate Test Matrices for plotBubbles***Description**

Generate a test matrix of random numbers (`mu` = mean and `sigma` = standard deviation), primarily for `plotBubbles`.

Usage

```
genMatrix(m,n,mu=0,sigma=1)
```

Arguments

m	number of rows
n	number of columns
mu	mean of normal distribution
sigma	standard deviation of normal distribution

Value

An m by n matrix with normally distributed random values.

See Also

[plotBubbles](#)

Examples

```
plotBubbles(genMatrix(20,6))
```

getChoice

Choose One String Item from a List of Choices

Description

Prompts the user to choose one string item from a list of choices displayed in a GUI. The simplest case `getChoice()` yields TRUE or FALSE.

Usage

```
getChoice(choice=c("Yes","No"), question="Make a choice: ",
          winname="getChoice", horizontal=TRUE, radio=FALSE,
          qcolor="blue", gui=FALSE, quiet=FALSE)
```

Arguments

choice	vector of strings from which to choose.
question	question or prompting statement.
winname	window name for the <code>getChoice</code> GUI.
horizontal	logical: if TRUE, display the choices horizontally, else vertically.
radio	logical: if TRUE, display the choices as radio buttons, else as buttons.
qcolor	colour for question.
gui	logical: if TRUE, <code>getChoice</code> is functional when called from a GUI, else it is functional from command line programs.
quiet	logical: if TRUE, don't print the choice on the command line.

Details

The user's choice is stored in `.PBSmod$options$getChoice` (or whatever `winname` is supplied).

`getChoice` generates an `onClose` function that returns focus to the calling window (if applicable) and prints out the choice.

Value

If called from a GUI (`gui=TRUE`), no value is returned directly. Rather, the choice is written to the PBS options workspace, accessible through `getPBSOptions("getChoice")` (or whatever winname was supplied).

If called from a command line program (`gui=FALSE`), the choice is returned directly as a string scalar (e.g., `answer <- getChoice(gui=F)`).

Note

Microsoft Windows users may experience difficulties switching focus between the R console and GUI windows. The latter frequently disappear from the screen and need to be reselected (either clicking on the task bar or pressing `<Alt><Tab>`). This issue can be resolved by switching from MDI to SDI mode. From the R console menu bar, select `<Edit>` and `<GUI preferences>`, then change the value of “single or multiple windows” to SDI.

See Also

`chooseWinVal`, `getWinVal`, `setWinVal`

Examples

```
## Not run:
##-- Example 1
getChoice(c("Fame", "Fortune", "Health", "Beauty", "Lunch"),
  "What do you want?", qcolor="red", gui=F)

##-- Example 2
getChoice(c("Homer Simpson", "Wilberforce Humphries", "Miss Marple"),
  "Who`s your idol?", horiz=F, radio=T, gui=F)
## End(Not run)
```

getGUIOptions

Get PBS Options for Widgets

Description

Get the PBS options declared for GUI usage and set their corresponding widget values.

Usage

```
getGUIOptions()
```

Details

The options declared using `declareGUIOptions` are copied from the R environment into widget values. These widgets should have names that match the names of their corresponding options.

See Also

`declareGUIOptions`, `setGUIOptions`, `promptWriteOptions`, `readPBSOptions`

Examples

```
## Not run:
getPBSOptions() #loads from default PBSOptions.txt
## End(Not run)
```

`getPBSext`*Get a Command Associated With a File Name*

Description

Display all locally defined file extensions and their associated commands, or search for the command associated with a specific file extension `ext`.

Usage

```
getPBSext (ext)
```

Arguments

`ext` optional string specifying a file extension.

Value

Command associated with file extension.

Note

These file associations are not saved from one *PBS Modelling* session to the next unless explicitly saved and loaded (see `writePBSoptions` and `readPBSoptions`).

See Also

[setPBSext](#), [openFile](#), [clearPBSext](#)

`getPBSoptions`*Retrieve A User Option*

Description

Get a previously defined user option.

Usage

```
getPBSoptions (option)
```

Arguments

`option` name of option to retrieve. If omitted, a list containing all options is returned.

Value

Value of the specified option, or `NULL` if the specified option is not found.

See Also

[getPBSext](#), [readPBSoptions](#)

`getWinAct`*Retrieve the Last Window Action*

Description

Get a string vector of actions (latest to earliest).

Usage

```
getWinAct (winName)
```

Arguments

`winName` name of window to retrieve action from

Details

When a function is called from a GUI, a string descriptor associated with the action of the function is stored internally (appended to the first position of the action vector). A user can utilize this action as a type of argument for programming purposes. The command `getWinAct () [1]` yields the latest action.

Value

String vector of recorded actions (latest first).

`getWinFun`*Retrieve Names of Functions Referenced in a Window*

Description

Get a vector of all function names referenced by a window.

Usage

```
getWinFun (winName)
```

Arguments

`winName` name of window, to retrieve its function list

Value

A vector of function names referenced by a window.

getWinVal

Retrieve Widget Values for Use in R Code

Description

Get a list of variables defined and set by the GUI widgets. An optional argument `scope` directs the function to create local or global variables based on the list that is returned.

Usage

```
getWinVal(v=NULL, scope="", asvector=FALSE, winName="")
```

Arguments

<code>v</code>	vector of variable names to retrieve from the GUI widgets. If <code>NULL</code> , <code>v</code> retrieves all variables from all GUI widgets.
<code>scope</code>	scope of the retrieval. The default sets no variables in the non-GUI environment; <code>scope="L"</code> creates variables locally in relation to the parent frame that called the function; and <code>scope="G"</code> creates global variables(<code>pos=1</code>).
<code>asvector</code>	return a vector instead of a list. WARNING: if a widget variable defines a true vector or matrix, this will not work.
<code>winName</code>	window from which to select GUI widget values. The default takes the window that has most recently received new user input.

Value

A list (or vector) with named components, where names and values are defined by GUI widgets.

See Also

`parseWinFile`, `setWinVal`, `clearWinVal`

getYes

Prompt the User to Choose Yes or No

Description

Display a message prompt with "Yes" and "No" buttons.

Usage

```
getYes(message, title="Choice", icon="question")
```

Arguments

<code>message</code>	message to display in prompt window.
<code>title</code>	title of prompt window.
<code>icon</code>	icon to display in prompt window; options are "error", "info", "question", or "warning".

Value

Returns TRUE if the "Yes" button is clicked, FALSE if the "No" button is clicked.

See Also

[showAlert](#), [getChoice](#), [chooseWinVal](#)

Examples

```
## Not run:
#default settings
if(getYes("Print the number 1?"))
  print(1)
## End(Not run)
```

importHistory	<i>Import a History List from a File</i>
---------------	------------------------------------------

Description

Import a history list from file `fname`, and place it into the history list `hisname`.

Usage

```
importHistory(hisname="", fname="", updateHis=TRUE)
```

Arguments

<code>hisname</code>	name of the history list to be populated. The default ("") uses the value from <code>getWinAct()[1]</code> .
<code>fname</code>	file name of history file to import. The default ("") causes an open-file window to be displayed.
<code>updateHis</code>	logical: if TRUE, update the history widget to reflect the change in size and index.

See Also

[exportHistory](#), [initHistory](#), [promptOpenFile](#)

initHistory	<i>Create Structures for a New History Widget</i>
-------------	---------------------------------------------------

Description

PBS history functions (below) are available to those who would like to use the package's history functionality, without using the pre-defined history widget. These functions allow users to create customized history widgets.

Usage

```
initHistory(hisname, indexname=NULL, sizename=NULL, modename=NULL,
            func=NULL, overwrite=TRUE)
rmHistory(hisname="", index="")
addHistory(hisname="")
forwHistory(hisname="")
backHistory(hisname="")
lastHistory(hisname="")
firstHistory(hisname="")
jumpHistory(hisname="", index="")
clearHistory(hisname="")
```

Arguments

hisname	name of the history "list" to manipulate. If it is omitted, the function uses the value of <code>getWinAct()[1]</code> as the history name. This allows the calling of functions directly from the <i>window description file</i> (except <code>initHistory</code> , which must be called before <code>createWin()</code>).
indexname	name of the index entry widget in the <i>window description file</i> . If <code>NULL</code> , then the current index feature will be disabled.
sizename	name of the current size entry widget. If <code>NULL</code> , then the current size feature will be disabled.
modename	name of the radio widgets used to change <code>addHistory</code> 's mode. If <code>NULL</code> , then the default mode will be to insert after the current index.
index	index to the history item. The default <code>("")</code> causes the value to be extracted from the widget identified by <code>indexname</code> .
func	name of user supplied function to call when viewing history items.
overwrite	if <code>TRUE</code> , history (matching <code>hisname</code>) will be cleared. Otherwise, the imported history will be merged with the current one.

Details

PBS Modelling includes a pre-built history widget designed to collect interesting choices of GUI variables so that they can be redisplayed later, rather like a slide show.

Normally, a user would invoke a history widget simply by including a reference to it in the *window description file*. However, PBS Modelling includes support functions (above) for customized applications.

To create a customized history, each button must be described separately in the *window description file* rather than making reference to the history widget.

The history "List" must be initialized before any other functions may be called. The use of a unique history name (`hisname`) is used to associate a unique history session with the supporting functions.

The `indexname` and `sizename` arguments correspond to the given names of entry widgets in the *window description file*, which will be used to display the current index and total size of the list. The `indexname` entry widget can also be used by `jumpHistory` to retrieve a target index.

Examples

```
## Not run:
# Example of creating a custom history widget that saves values
# whenever the "Plot" button is pressed. The user can tweak the
```

```

# inputs "a", "b", and "points" before each "Plot" and see the
# "Index" increase. After sufficient archiving, the user can review
# scenarios using the "Back" and "Next" buttons.
# A custom history is needed to achieve this functionality since
# the packages pre-defined history widget does not update plots.

# To start, create a Window Description to be used with createWin
# using astring=TRUE. P.S. Watch out for special characters which
# must be "escaped" twice (first for R, then PBSmodelling).

winDesc <- '
  window title="Custom History"
  vector names="a b k" labels="a b points" font="bold" \\
  values="1 1 1000" function=myPlot
  grid 1 3
    button function=myHistoryBack text="<- Back"
    button function=myPlot text="Plot"
    button function=myHistoryForw text="Next ->"
  grid 2 2
    label "Index"
    entry name="myHistoryIndex" width=5
    label "Size"
    entry name="myHistorySize" width=5
'

# Convert text to vector with each line represented as a new element
winDesc <- strsplit(winDesc, "\n")[[1]]

# Custom functions to update plots after restoring history values
myHistoryBack <- function() {
  backHistory("myHistory");
  myPlot(saveVal=FALSE); # show the plot with saved values
}
myHistoryForw <- function() {
  forwHistory("myHistory");
  myPlot(saveVal=FALSE); # show the plot with saved values
}
myPlot <- function(saveVal=TRUE) {
  # save all data whenever plot is called (directly)
  if (saveVal) addHistory("myHistory");
  getWinVal(scope="L");
  tt <- 2*pi*(0:k)/k;
  x <- (1+sin(a*tt)); y <- cos(tt)*(1+sin(b*tt));
  plot(x, y);
}

initHistory("myHistory", "myHistoryIndex", "myHistorySize")
createWin(winDesc, astring=TRUE)
## End(Not run)

```

Description

Identify an object by class, mode, typeof, and attributes.

Usage

```
isWhat(x)
```

Arguments

`x` an R object

Value

No value is returned. The function prints the object's characteristics on the command line.

loadC

Launch a GUI for Compiling and Loading C Code

Description

A GUI interface allows users to edit, compile, and embed C functions in the R environment.

Usage

```
loadC()
```

Details

The function `loadC()` launches an interactive GUI that can be used to manage the construction of C functions intended to be called from R. The GUI provides tools to edit, compile, load, and run C functions in the R environment.

The `loadC` GUI also includes a tool for comparison between the running times and return values of R and C functions. It is assumed that the R and C functions are named `prefix.r` and `prefix.c`, respectively, where `prefix` can be any user-chosen prefix. If an initialization function `prefix.init` exists, it is called before the start of the comparison.

The GUI controls:

File Prefix	Prefix for <code>.c</code> and <code>.r</code> files.
Lib Prefix	Prefix for shared library object.
Set WD	Set the working directory.
Open Log	Open the log file.
Open.c File	Open the file <code>prefix.c</code> from the working directory.
Open .r File	Open the file <code>prefix.r</code> from the working directory.
COMPILE	Compile <code>prefix.c</code> into a shared library object.
LOAD	Load the shared library object.
SOURCE R	Source the file <code>prefix.r</code> .
UNLOAD	Unload the shared library object.
Options	
Editor	Text editor to use.
Update	Commit option changes.
Browse	Browse for a text editor.
Clean Options	
Select All	Select all check boxes specifying file types.
Select None	Select none of the check boxes.
Clean Proj	Clean the project of selected file types.
Clean All	Clean the directory of selected file types.

Comparison	
Times to Run	Number of times to run the R and C functions.
RUN	Run the comparison between R and C functions.
R Time	Computing time to run the R function multiple times.
C Time	Computing time to run the C function multiple times.
Ratio	Ratio of R/C run times.

See Also

[compileC](#)

openExamples

Open Example Files from a Package

Description

Open examples from the examples subdirectory of a given package.

Usage

```
openExamples(package, prefix, suffix)
```

Arguments

package	name of the package that contains the examples.
prefix	prefix of the example file(s).
suffix	character vector of suffixes for the example files.

Details

Copies of each example file are placed in the working directory and opened. If files with the same name already exist, the user is prompted with a choice to overwrite.

To use this function in a *window description file*, the package, prefix and suffix arguments must be specified as the action of the widget that calls openExamples. Furthermore, package, prefix, and each suffix must be separated by commas. For example, action=myPackage,example1,.r,.c will copy example1.r and example2.c from the examples directory of the package **myPackage** to the working directory and open these files. If the function was called by a widget, a widget named prefix will be set to the specified prefix.

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

See Also

[openFile](#), [openProjFiles](#), [openPackageFile](#)

Examples

```
## Not run:
# Copies example1.c and example2.r from the examples directory in
# myPackage to the working directory, and opens these files
openExamples("myPackage", "example1", c(".r", ".c"))
## End(Not run)
```

openFile	<i>Open a File with an Associated Program</i>
----------	-----------------------------------------------

Description

Open a file using the program associated with its extension defined by the Windows shell. Non-windows users, or users wishing to override the default application, can specify a program association using `setPBSext`.

Usage

```
openFile(fname)
```

Arguments

fname	name of file to open.
-------	-----------------------

Value

An invisible string vector of the file names and/or commands + file names.

Note

If a command is registered with `setPBSext`, then `openFile` will replace all occurrences of "%f" with the absolute path of the filename, before executing the command.

See Also

[getPBSext](#), [setPBSext](#), [clearPBSext](#), [writePBSoptions](#)

Examples

```
## Not run:
# Set up firefox to open .html files
setPBSext("html", '"c:/Program Files/Mozilla Firefox/firefox.exe" file://%f')
openFile("foo.html")
## End(Not run)
```

openPackageFile	<i>Open a File from a Package Subdirectory</i>
-----------------	------------------------------------------------

Description

Open a file from a package in the R library, given the package name and the file path relative to the package root directory.

Usage

```
openPackageFile(package, filepath)
```

Arguments

package	name of the package
filepath	path to file from the package's root directory

Details

The `openFile` function is used to open the file, using associations set by `setPBSext`.

To use this function in a *window description file*, the `package` and `filepath` arguments must be specified as the action of the widget that calls `openPackageFile`. Furthermore, `package` and `filepath` must be separated by commas (e.g., `action=myPackage, /doc/help.pdf`).

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

See Also

[openFile](#), [setPBSext](#), [openProjFiles](#), [openExamples](#)

Examples

```
## Not run:
openPackageFile("myPackage", "/doc/help.pdf")
## End(Not run)
```

openProjFiles	<i>Open Files with a Common Prefix</i>
---------------	----------------------------------------

Description

Open one or more files from the working directory, given one file prefix and one or more file suffixes.

Usage

```
openProjFiles(prefix, suffix, package=NULL, warn=NULL, alert=TRUE)
```

Arguments

<code>prefix</code>	a single prefix to prepend to each suffix
<code>suffix</code>	a character vector of suffixes to append to the prefix
<code>package</code>	name of the package that contains templates, or <code>NULL</code> to not use templates
<code>warn</code>	if specified, use to temporarily override the current R warn option during this function's activity; if <code>NULL</code> , the current warning settings are used.
<code>alert</code>	if <code>TRUE</code> , an alert message is shown should any files fail to be opened; if <code>FALSE</code> , no alert is displayed.

Details

The suffixes may contain wildcards ("`*`" to match 0 or more characters, "?" to match any single character).

For any file that does not exist in the working directory, a template can optionally be copied from a directory named `templates` in the specified package. The templates in this directory should have the prefix `template`, followed by the suffix to match when `openProjFiles` is called (e.g., `template.c` to match the suffix `.c`). After being copied to the working directory, the new file is renamed to use the specified prefix.

To use this function in a *window description file*, the `package` and `suffix` arguments must be specified as the action of the widget that calls `openProjFiles`. Furthermore, `package` and each `suffix` must be separated by commas. For example, `action=myPackage, .r, .c` will try to open a `.r` and `.c` file in the working

directory, copying templates from the `template` directory for the package **myPackage**, if the files didn't already exist. To disable templates, leave `package` unspecified but keep the leading comma (e.g., `action=, .r, .c`). When the function is called from a widget in this fashion, the prefix is taken from the value of a widget named `prefix`.

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

Examples

```
## Not run:
openProjFiles("foo", c(".r", ".c"), package="myPackage")
## End(Not run)
```

pad0

Pad Numbers with Leading Zeroes

Description

Convert numbers to integers then text, and pad them with leading zeroes.

Usage

```
pad0(x, n, f = 0)
```

Arguments

<code>x</code>	vector of numbers
<code>n</code>	number of text characters representing a padded integer
<code>f</code>	factor of 10 transformation on <code>x</code> before padding

Value

A character vector representing `x` with leading zeroes.

Examples

```
resetGraph(); x <- pad0(x=123,n=10,f=0:7);
addLabel(.5,.5,paste(x,collapse="\n"),cex=1.5);
```

 parseWinFile

Convert a Window Description File into a List Object

Description

Parse a *window description file* (markup file) into the list format expected by `createWin`.

Usage

```
parseWinFile(fname, astext=FALSE)
```

Arguments

<code>fname</code>	file name of the <i>window description file</i> .
<code>astext</code>	if TRUE, <code>fname</code> is interpreted as a vector of strings, with each element representing a line of code in a <i>window description file</i> .

Value

A list representing a parsed *window description file* that can be directly passed to `createWin`.

Note

All widgets are forced into a 1-column by N-row grid.

See Also

[createWin](#), [compileDescription](#)

Examples

```
## Not run:
x<-parseWinFile(system.file("examples/LissFigWin.txt",package="PBSmodelling"))
createWin(x)
## End(Not run)
```

 pause

Pause Between Graphics Displays or Other Calculations

Description

Pause, typically between graphics displays. Useful for demo purposes.

Usage

```
pause(s = "Press <Enter> to continue")
```

Arguments

<code>s</code>	text issued on the command line when <code>pause</code> is invoked.
----------------	---------------------------------------------------------------------

pickCol

Pick a Colour From a Palette and get the Hexadecimal Code

Description

Display an interactive colour palette from which the user can choose a colour.

Usage

```
pickCol(returnValue=TRUE)
```

Arguments

`returnValue` If TRUE, display the full colour palette, choose a colour, and return the hex value to the R session.
If FALSE, use an intermediate GUI to interact with the palette and display the hex value of the chosen colour.

Value

A hexadecimal colour value.

See Also

[testCol](#)

Examples

```
## Not run:
junk<-pickCol(); resetGraph(); addLabel(.5,.5,junk,cex=4,col=junk);
## End(Not run)
```

plotACF

Plot Autocorrelation Bars From a Data Frame, Matrix, or Vector

Description

Plot autocorrelation bars (ACF) from a data frame, matrix, or vector.

Usage

```
plotACF(file, lags=20,
        clr=c("blue", "red", "green", "magenta", "navy"), ...)
```

Arguments

`file` data frame, matrix, or vector of numeric values.
`lags` maximum number of lags to use in the ACF calculation.
`clr` vector of colours. Patterns are repeated if the number of fields exceed the length of `clr`.
`...` additional arguments for `plot` or `lines`.

Details

This function is designed primarily to give greater flexibility when viewing results from the R-package BRugs. Use `plotACF` in conjunction with `samplesHistory(" ", beg=0, plot=FALSE)` rather than `samplesAutoC` which calls `plotAutoC`.

Examples

```
resetGraph(); plotACF(trees, lwd=2, lags=30);
```

plotAsp	<i>Construct a Plot with a Specified Aspect Ratio</i>
---------	-------------------------------------------------------

Description

Plot x and y coordinates using a specified aspect ratio.

Usage

```
plotAsp(x, y, asp=1, ...)
```

Arguments

<code>x</code>	vector of x -coordinate points in the plot.
<code>y</code>	vector of y -coordinate points in the plot.
<code>asp</code>	y/x aspect ratio.
<code>...</code>	additional arguments for <code>plot</code> .

Details

The function `plotAsp` differs from `plot(x, y, asp=1)` in the way axis limits are handled. Rather than expand the range, `plotAsp` expands the margins through padding to keep the aspect ratio accurate.

Examples

```
x <- seq(0, 10, 0.1)
y <- sin(x)
par(mfrow=2:1)
plotAsp(x, y, asp=1, xlim=c(0, 10), ylim=c(-2, 2), main="sin(x)")
plotAsp(x, y^2, asp=1, xlim=c(0, 10), ylim=c(-2, 2), main="sin^2(x)")
```

plotBubbles

Construct a Bubble Plot from a Matrix

Description

Construct a bubble plot for a matrix *z*.

Usage

```
plotBubbles(z, xval=FALSE, yval=FALSE, dnam=FALSE, rpro=FALSE,
  cpro=FALSE, rres=FALSE, cres=FALSE, powr=1, size=0.2, lwd=2,
  clrs=c("black", "red", "blue"), hide0=FALSE, debug=FALSE, ...)
```

Arguments

<i>z</i>	input matrix
<i>xval</i>	x-values for the columns of <i>z</i> . if <i>xval</i> =TRUE, the first row contains x-values for the columns.
<i>yval</i>	y-values for the rows of <i>z</i> . If <i>yval</i> =TRUE, the first column contains y-values for the rows.
<i>dnam</i>	logical: if TRUE, attempt to use dimnames of input matrix <i>z</i> as <i>xval</i> and <i>yval</i> . The dimnames are converted to numeric values and must be strictly increasing or decreasing. If successful, these values will overwrite previously specified values of <i>xval</i> and <i>yval</i> or any default indices.
<i>rpro</i>	logical: if TRUE, convert rows to proportions.
<i>cpro</i>	logical: if TRUE, convert columns to proportions.
<i>rres</i>	logical: if TRUE, use row residuals (subtract row means).
<i>cres</i>	logical: if TRUE, use column residuals (subtract column means).
<i>powr</i>	power transform. Radii are proportional to z^{powr} . Note: <i>powr</i> =0.5 yields bubble areas proportional to <i>z</i> .
<i>size</i>	size (inches) of the largest bubble.
<i>lwd</i>	line width for drawing circles.
<i>clrs</i>	colours (3-element vector) used for positive, negative, and zero values, respectively.
<i>hide0</i>	logical: if TRUE, hide zero-value bubbles.
<i>debug</i>	logical: if TRUE, display debug information.
...	additional arguments for <i>symbols</i> function.

Details

The function *plotBubbles* essentially flips the *z* matrix visually. The columns of *z* become the x-values while the rows of *z* become the y-values, where the first row is displayed as the bottom y-value and the last row is displayed as the top y-value. The function's original intention was to display proportions-at-age vs. year.

See Also

[genMatrix](#)

Examples

```
plotBubbles(round(genMatrix(40,20),0),clrs=c("green","grey","red"));

data(CCA.qbr)
plotBubbles(CCA.qbr,cpro=TRUE,powr=.5,dnam=TRUE,size=.15,
  ylim=c(0,70),xlab="Year",ylab="Quillback Rockfish Age")
```

plotCsum

*Plot Cumulative Sum of Data***Description**

Plot the cumulative frequency of a data vector or matrix, showing the median and mean of the distribution.

Usage

```
plotCsum(x, add = FALSE, ylim = c(0, 1), xlab = "Measure",
  ylab = "Cumulative Proportion", ...)
```

Arguments

<code>x</code>	vector or matrix of numeric values.
<code>add</code>	logical: if TRUE, add the cumulative frequency curve to a current plot.
<code>ylim</code>	limits for the y-axis.
<code>xlab</code>	label for the x-axis.
<code>ylab</code>	label for the y-axis.
<code>...</code>	additional arguments for the <code>plot</code> function.

Examples

```
x <- rgamma(n=1000,shape=2)
plotCsum(x)
```

plotDens

*Plot Density Curves from a Data Frame, Matrix, or Vector***Description**

Plot the density curves from a data frame, matrix, or vector. The mean density curve of the data combined is also shown.

Usage

```
plotDens(file, clrs=c("blue","red","green","magenta","navy"), ...)
```

Arguments

<code>file</code>	data frame, matrix, or vector of numeric values.
<code>clrs</code>	vector of colours. Patterns are repeated if the number of fields exceed the length of <code>clrs</code> .
<code>...</code>	additional arguments for <code>plot</code> or <code>lines</code> .

Details

This function is designed primarily to give greater flexibility when viewing results from the R-package BRugs. Use `plotDens` in conjunction with `samplesHistory(" ", beg=0, plot=FALSE)` rather than `samplesDensity` which calls `plotDensity`.

Examples

```
z <- data.frame(y1=rnorm(50, sd=2), y2=rnorm(50, sd=1), y3=rnorm(50, sd=.5))
plotDens(z, lwd=3)
```

plotFriedEggs

Render a Pairs Plot as Fried Eggs and Beer

Description

Create a pairs plot where the lower left half comprises either fried egg contours or smoke ring contours, the upper right half comprises glasses of beer filled to the correlation point, and the diagonals show frequency histograms of the input data.

Usage

```
plotFriedEggs(A, eggs=TRUE, rings=TRUE, levs=c(0.01, 0.1, 0.5, 0.75, 0.95),
              pepper=200, replace=FALSE, jitt=c(1, 1), bw=25, histclr=NULL)
```

Arguments

A	data frame or matrix for use in a pairs plot.
eggs	logical: if TRUE, fry eggs in the lower panels.
rings	logical: if TRUE, blow smoke rings in the lower panels.
levs	explicit contour levels expressed as quantiles.
pepper	number of samples to draw from A to pepper the plots.
replace	logical: if TRUE, sample A with replacement.
jitt	argument factor used by function <code>base::jitter</code> when peppering. If user supplies two numbers, the first will jitter x, the second will jitter y.
bw	argument bandwidth used by function <code>KernSmooth::bkde2D</code> .
histclr	user-specified colour(s) for histogram bars along the diagonal.

Details

This function comes to us from Dr. Steve Martell of the Fisheries Science Centre at UBC. Obviously many hours of contemplation with his students at the local pub have contributed to this unique rendition of a pairs plot.

Note

If `eggs=TRUE` and `rings=FALSE`, fried eggs are served.
 If `eggs=FALSE` and `rings=TRUE`, smoke rings are blown.
 If `eggs=TRUE` and `rings=TRUE`, only fried eggs are served.
 If `eggs=FALSE` and `rings=FALSE`, only pepper is sprinkled.

See Also

[plotBubbles](#), [scalePar](#)

`KernSmooth::bkde2D`, `grDevices::contourLines`, `graphics::contour`

Examples

```
x=rnorm(5000,10,3); y=-x+rnorm(5000,1,4); z=x+rnorm(5000,1,3)
A=data.frame(x=x,y=y,z=z)
plotFriedEggs(A,eggs=TRUE,rings=FALSE)
pause("Here are the eggs...(Press Enter for next)")
plotFriedEggs(A,eggs=FALSE,rings=TRUE)
pause("Here are the rings...(Press Enter for next)")
plotFriedEggs(A,eggs=FALSE,rings=FALSE)
cat("Here is the pepper alone.\n")
```

plotTrace

Plot Trace Lines from a Data Frame, Matrix, or Vector

Description

Plot trace lines from a data frame or matrix where the first field contains x-values, and subsequent fields give y-values to be traced over x. If input is a vector, this is traced over the number of observations.

Usage

```
plotTrace(file, clr=c("blue","red","green","magenta","navy"), ...)
```

Arguments

file	data frame or matrix of x and y-values, or a vector of y-values.
clr	vector of colours. Patterns are repeated if the number of traces (y-fields) exceed the length of clr.
...	additional arguments for plot or lines.

Details

This function is designed primarily to give greater flexibility when viewing results from the R-package BRugs. Use `plotTrace` in conjunction with `samplesHistory(" ", beg=0, plot=FALSE)` rather than `samplesHistory` which calls `plotHistory`.

Examples

```
z <- data.frame(x=1:50,y1=rnorm(50,sd=3),y2=rnorm(50,sd=1),y3=rnorm(50,sd=.25))
plotTrace(z,lwd=3)
```

presentTalk	<i>Run an R Presentation</i>
-------------	------------------------------

Description

Start an R talk from a *talk description file* that launches a control GUI.

Usage

```
presentTalk(x, debug=FALSE)
```

Arguments

x	string name of <i>talk description file</i> .
debug	logical: if TRUE, the command line reflects indices and some booleans.

Details

`presentTalk` is a tool that facilitates lectures and workshops in R. The function allows the presenter to show code snippets alongside their execution, making use of R's graphical capabilities. When `presentTalk` is called, a graphical user interface (GUI) is launched that allows the user to control the flow of the talk (e.g., switching between talks or skipping to various sections of a talk).

The automatic control buttons allow the user to move forward or backward in the talk. The `GO` button moves forward one tag segment, the `Back` button moves back to the previous tag segment. The blue buttons allow movement among sections - `Start` to the first section of the talk, `Prev` to the previous section, `Curr` to the start of the current section, and `Next` to the next section.

In addition to the automatic menu items, a user can add buttons to the GUI that accomplish similar purposes.

Note

The use of `chunk` in the R code is equivalent to the use of `segment` in the documentation. See the PBSmodelling User's Guide for more information.

promptOpenFile	<i>Display an "Open File" Dialogue</i>
----------------	----------------------------------------

Description

Display the default **Open** prompt provided by the Operating System.

Usage

```
promptOpenFile(initialfile="", filetype=list(c("*", "All Files")),
               open=TRUE)
```

Arguments

initialfile	file name of the text file containing the list.
filetype	a list of character vectors indicating file types made available to users of the GUI. Each vector is of length one or two. The first element specifies either the file extension or "*" for all file types. The second element gives an optional descriptor name for the file type. The supplied filetype list appears as a set of choices in the pull-down box labelled "Files of type:".
open	logical: if TRUE display Open prompt, if FALSE display Save As prompt.

Value

The file name and path of the file selected by the user.

See Also

`promptSaveFile`

Examples

```
## Not run:
# Open a filename, and return it line by line in a vector
scan(promptOpenFile(), what=character(), sep="\n")

# Illustrates how to set filetype.
promptOpenFile("initial_file.txt", filetype=list(c(".txt", "text files"),
                                                  c(".r", "R files"), c("*", "All Files")))
## End(Not run)
```

promptSaveFile	<i>Display a "Save File" Dialogue</i>
----------------	---------------------------------------

Description

Display the default **Save As** prompt provided by the Operating System.

Usage

```
promptSaveFile(initialfile="", filetype=list(c("*", "All Files")),
               save=TRUE)
```

Arguments

initialfile	file name of the text file containing the list.
filetype	a list of character vectors indicating file types made available to users of the GUI. Each vector is of length one or two. The first element specifies either the file extension or "*" for all file types. The second element gives an optional descriptor name for the file type. The supplied filetype list appears as a set of choices in the pull-down box labelled "Files of type:".
save	logical: if TRUE display Save As prompt, if FALSE display Open prompt.

Value

The file name and path of the file selected by the user.

See Also

[promptOpenFile](#)

Examples

```
## Not run:
#illustrates how to set filetype.
promptSaveFile("intial_file.txt", filetype=list(c(".txt", "text files"),
                                                c(".r", "R files"), c("*", "All Files")))
## End(Not run)
```

`promptWriteOptions` *Prompt the User to Write Changed Options*

Description

If changes have been made to PBS options, this function allows the user to choose whether to write PBS options to an external file that can be loaded later by `readPBSOptions`.

Usage

```
promptWriteOptions(fname="")
```

Arguments

`fname` name of file where options will be saved.

Details

If there are options that have been changed in the GUI but have not been committed to PBSmodelling memory in the global R environment, the user is prompted to choose whether or not to commit these options.

Then, if any PBS options have been changed, the user is prompted to choose whether to save these options to the file `fname`. (When a new R session is started or when a call to `readPBSOptions` or `writePBSOptions` is made, PBS options are considered to be unchanged; when an option is set, the options are considered to be changed).

If `fname=""`, the user is prompted to save under the file name last used by a call to `readPBSOptions` or `writePBSOptions` if available. Otherwise, the default file name "PBSOptions.txt" is used.

See Also

[writePBSOptions](#), [readPBSOptions](#), [setPBSOptions](#)

Examples

```
## Not run:
promptWriteOptions() #uses default filename PBSOptions.txt
## End(Not run)
```

readList

Read a List from a File in PBS Modelling Format

Description

Read in a list previously saved to a file by `writeList`. At present, only two formats are supported - R's native format used by the `dput` function or an ad hoc `PBSmodelling` format. The function `readList` detects the format automatically.

For information about the `PBSmodelling` format, see `writeList`.

Usage

```
readList(fname)
```

Arguments

`fname` file name of the text file containing the list.

See Also

[writeList](#), [unpackList](#)

readPBSOptions

Read PBS Options from an External File

Description

Load options that were saved using `writePBSOptions`, for use with `openFile`, `getPBSOptions` or interfaces such as `loadC`.

Usage

```
readPBSOptions(fname="PBSOptions.txt")
```

Arguments

`fname` file name or full path of file from which the options will be loaded.

Note

If an option exists in R memory but not in the saved file, the option is not cleared from memory.

See Also

[writePBSOptions](#), [getGUIOptions](#), [openFile](#), [getPBSOptions](#)

resetGraph

Reset par Values for a Plot

Description

Reset `par()` to default values to ensure that a new plot utilizes a full figure region. This function helps manage the device surface, especially after previous plotting has altered it.

Usage

```
resetGraph()
```

See Also

[resetGraph](#)

restorePar

Get Actual Parameters from Scaled Values

Description

Restore scaled parameters to their original units. Used in minimization by `calcMin`.

Usage

```
restorePar(S, pvec)
```

Arguments

<code>S</code>	scaled parameter vector.
<code>pvec</code>	a data frame comprising four columns - <code>c("val", "min", "max", "active")</code> and as many rows as there are model parameters. The "active" field (logical) determines whether the parameters are estimated (TRUE) or remain fixed (FALSE).

Details

Restoration algorithm: $P = P_{min} + (P_{max} - P_{min})(\sin(\frac{\pi S}{2}))^2$

Value

Parameter vector converted from scaled units to original units specified by `pvec`.

See Also

[scalePar](#), [calcMin](#), [GT0](#)

Examples

```
pvec <- data.frame(val=c(1,100,10000),min=c(0,0,0),max=c(5,500,50000),
  active=c(TRUE,TRUE,TRUE))
S <- c(.5,.5,.5)
P <- restorePar(S,pvec)
print(cbind(pvec,S,P))
```

runDemos

Interactive GUI for R Demos

Description

An interactive GUI for accessing demos from any R package installed on the user's system. `runDemos` is a convenient alternative to R's `demo` function.

Usage

```
runDemos(package)
```

Arguments

`package` display demos from a particular package (optional).

Details

If the argument `package` is not specified, the function will look for demos in all packages installed on the user's system.

Note

The `runDemos` GUI attempts to retain the user's objects and restore the working directory. However, pre-existing objects will be overwritten if their names co-incide with names used by the various demos. Also, depending on conditions, the user may lose working directory focus. We suggest that users run this demo from a project where data objects are not critical. — **USER BEWARE** —

See Also

[runExamples](#) for examples specific to **PBSmodelling**.

runExamples

Run GUI Examples Included with PBS Modelling

Description

Display an interactive GUI to demonstrate PBS Modelling examples.

The example source files can be found in the R directory `.../library/PBSmodelling/examples`.

Usage

```
runExamples()
```

Details

Some examples use external packages which must be installed to work correctly:

BRugs - LinReg, MarkRec, and CCA;

odesolve/ddesolve - FishRes;

PBSmapping - FishTows.

Note

The examples are copied from `.../library/PBSmodelling/examples` to R's current temporary working directory and run from there.

See Also

[runDemos](#)

scalePar	<i>Scale Parameters to [0,1]</i>
----------	----------------------------------

Description

Scale parameters for function minimization by `calcMin`.

Usage

```
scalePar(pvec)
```

Arguments

`pvec` a data frame comprising four columns - `c("val", "min", "max", "active")` and as many rows as there are model parameters. The "active" field (logical) determines whether the parameters are estimated (TRUE) or remain fixed (FALSE).

Details

Scaling algorithm: $S = \frac{2}{\pi} \arcsin \sqrt{\frac{P - P_{min}}{P_{max} - P_{min}}}$

Value

Parameter vector scaled between 0 and 1.

See Also

[restorePar](#), [calcMin](#), [GT0](#)

Examples

```
pvec <- data.frame(val=c(1,100,10000),min=c(0,0,0),max=c(5,500,50000),
  active=c(TRUE,TRUE,TRUE))
S <- scalePar(pvec)
print(cbind(pvec,S))
```

setFileOption	<i>Set a PBS File Path Option Interactively</i>
---------------	-------------------------------------------------

Description

Set a PBS option by browsing for a file. This function provides an alternative to using `setPBSOptions` when setting an option that has a path to a file as its value.

Usage

```
setFileOption(option)
```

Arguments

<code>option</code>	name PBS option to change
---------------------	---------------------------

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

See Also

[setPathOption](#), [setPBSOptions](#)

Examples

```
## Not run:  
setPathOption("editor")  
## End(Not run)
```

setGUIOptions	<i>Set PBS Options from Widget Values</i>
---------------	-------------------------------------------

Description

Set PBS options from corresponding values of widgets in a GUI.

Usage

```
setGUIOptions(option)
```

Arguments

<code>option</code>	the name of a single option or the string "*" .
---------------------	-------------------------------------------------

Details

A GUI may have PBS options that it uses, which have corresponding widgets that are used for entering values for these options. These are declared by `declareGUIOptions`.

If the `option` argument is the name of an option, `setGUIOptions` transfers the value of this option from a same-named widget into PBS options global R environment database.

If the `option` argument is `"*"`, then all the options that have been declared by `declareGUIOptions` will be transferred in this fashion.

To use this function in a *window description file*, the `option` argument must be specified as the action of the widget that calls `setGUIOptions` – `action=editor` or `action=*` for example.

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

See Also

[declareGUIOptions](#), [getGUIOptions](#), [setPBSOptions](#),

Examples

```
## Not run:
setGUIOptions("editor")
## End(Not run)
```

setPBSext

Set a Command Associated with a File Name Extension

Description

Set a command with an associated extension, for use in `openFile`. The command must specify where the target file name is inserted by indicating a `"%f"`.

Usage

```
setPBSext(ext, cmd)
```

Arguments

<code>ext</code>	string specifying the extension suffix.
<code>cmd</code>	command string to associate with the extension.

Note

These values are not saved from one *PBS Modelling* session to the next.

See Also

[getPBSext](#), [openFile](#), [clearPBSext](#)

setPBSoptions	<i>Set A User Option</i>
---------------	--------------------------

Description

Options set by the user for use by other functions.

Usage

```
setPBSoptions(option, value, sublist=FALSE)
```

Arguments

option	name of the option to set.
value	new value to assign this option.
sublist	if value is a sublist (list component) of option, this list component can be changed individually using sublist=TRUE.

Note

A value `.PBSmod$.options$.optionsChanged` is set to `TRUE` when an option is changed, so that the user doesn't always have to be prompted to save the options file.

By default, `.PBSmod$.options$.optionsChanged` is not set or `NULL`.

Also, if an option is set to `" "` or `NULL` then it is removed.

`.initPBSoptions()` is now called first (options starting with a dot "." do not set `.optionsChanged`).

See Also

[getPBSoptions](#), [writePBSoptions](#), [readPBSoptions](#)

setPathOption	<i>Set a PBS Path Option Interactively</i>
---------------	--------------------------------------------

Description

Set a PBS option by browsing for a directory. This function provides an alternative to using `setPBSoptions` when setting an option that has a path as its value.

Usage

```
setPathOption(option)
```

Arguments

option	name PBS option to change
--------	---------------------------

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

See Also

[setFileOption](#), [setPBSoptions](#)

Examples

```
## Not run:
setPathOption("myPath")
## End(Not run)
```

setWinAct

Add a Window Action to the Saved Action Vector

Description

Append a string value specifying an action to the first position of an action vector.

Usage

```
setWinAct(winName, action)
```

Arguments

winName	window name where action is taking place.
action	string value describing an action.

Details

When a function is called from a GUI, a string descriptor associated with the action of the function is stored internally (appended to the first position of the action vector). A user can utilize this action as a type of argument for programming purposes. The command `getWinAct()[1]` yields the latest action.

Sometimes it is useful to “fake” an action. Calling `setWinAct` allows the recording of an action, even if a button has not been pressed.

setWinVal

Update Widget Values

Description

Update a widget with a new value.

Usage

```
setWinVal(vars, winName)
```

Arguments

vars	a list or vector with named components.
winName	window from which to select GUI widget values. The default takes the window that has most recently received new user input.

Details

The `vars` argument expects a list or vector with named elements. Every element name corresponds to the widget name which will be updated with the supplied element value.

The `vector`, `matrix`, and `data` widgets can be updated in several ways. If more than one name is specified for the `names` argument of these widgets, each element is treated like an `entry` widget.

If however, a single name describes any of these three widgets, the entire widget can be updated by passing an appropriately sized object.

Alternatively, any element can be updated by appending its index in square brackets to the end of the `name`. The `data` widget is indexed differently than the `matrix` widget by adding "d" after the brackets. This tweak is necessary for the internal coding (bookkeeping) of *PBS Modelling*. Example: `"foo[1,1]d"`.

See Also

`getWinVal`, `createWin`

Examples

```
## Not run:
winDesc <- c("vector length=3 name=vec",
             "matrix nrow=2 ncol=2 name=mat",
             "slideplus name=foo");
createWin(winDesc, astatic=TRUE)
setWinVal(list(vec=1:3, "mat[1,1]"=123, foo.max=1.5, foo.min=0.25, foo=0.7))
## End(Not run)
```

setwdGUI

Browse for Working Directory and Optionally Find Prefix

Description

Allows the user to browse a directory tree to set the working directory. Optionally, files with given suffixes can be located in the new directory.

Usage

```
setwdGUI(suffix)
```

Arguments

`suffix` character vector of suffixes or "" (See Details).

Details

The `suffix` argument is passed to a call to `findPrefix` after the working directory is changed (See `setwd`). If `suffix` is set to the empty string "", then `findPrefix` will not be called.

To use this function in a *window description file*, the `suffix` argument must be specified as the action of the widget that calls `setwdGUI`. Furthermore, the suffixes must be separated by commas (e.g., `action=.c, .cpp`). If `action=`, is specified, then `findPrefix` will not be called.

Value

If suffixes are given, a character vector of prefixes of all files in the working directory that match one of the given suffixes is returned; otherwise, the function returns `invisible()`.

Note

If all the required arguments are missing, it is assumed that the function is being called by a GUI widget.

See Also

`findPrefix`, `setwd`

Examples

```
## Not run:
#match files that end with ".a" followed by 0 or more characters, ".b" followed
#by any single character, ".c", or "-old.d" (a suffix does not have to be a
#file extension)
findPrefix(".a*", ".b?", ".c", "-old.d")
## End(Not run)
```

show0

Convert Numbers into Text with Specified Decimal Places

Description

Return a character representation of a number with added zeroes out to a specified number of decimal places.

Usage

```
show0(x, n, add2int = FALSE)
```

Arguments

x	numeric data (scalar, vector, or matrix).
n	number of decimal places to show, including zeroes.
add2int	If TRUE, add zeroes on the end of integers.

Value

A scalar/vector of strings representing numbers. Useful for labelling purposes.

Note

This function does not round or truncate numbers. It simply adds zeroes if n is greater than the available digits in the decimal part of a number.

Examples

```
frame()

#do not show decimals on integers
addLabel(0.25,0.75,show0(15.2,4))
addLabel(0.25,0.7,show0(15.1,4))
addLabel(0.25,0.65,show0(15,4))

#show decimals on integers
addLabel(0.25,0.55,show0(15.2,4,TRUE))
addLabel(0.25,0.5,show0(15.1,4,TRUE))
addLabel(0.25,0.45,show0(15,4,TRUE))
```

showAlert	<i>Display a Message in an Alert Window</i>
-----------	---------------------------------------------

Description

Display an alert window that contains a specified message and an OK button for dismissing the window.

Usage

```
showAlert(message, title="Alert", icon="warning")
```

Arguments

message	message to display in alert window
title	title of alert window
icon	icon to display in alert window; options are "error", "info", "question", or "warning".

See Also

[getYes](#)

Examples

```
## Not run:
showAlert("Hello World!")
## End(Not run)
```

showArgs	<i>Display Expected Widget Arguments</i>
----------	------------------------------------------

Description

Display the order and default values of **all** widget arguments. The list can be shortened by specifying a single widget name.

Usage

```
showArgs(widget="")
```

Arguments

widget	If specified, information about this one widget only is displayed. The default displays information about all widgets.
--------	------------------------------------------------------------------------------------------------------------------------

Value

A text stream to the R console. Cannot be directed to a file or other device.

`showHelp`*Display Help Pages for Packages in HTML Browser*

Description

Display the help pages for installed packages that match the supplied pattern in an HTML browser window.

Usage

```
showHelp(pat="methods")
```

Arguments

<code>pat</code>	string pattern to match to package names
------------------	------------------------------------------

Details

The specified pattern is matched to R-packages installed on the user's system. The code uses the `PBSmodelling` function `openFile` to display the HTML Help Pages using a program that the system associates with `html` extensions. On systems that do not support file extension associations, the function `setPBSext` can temporarily set a command to associate with an extension.

Value

A list is invisibly returned, comprising:

<code>Apacks</code>	all packages installed on user's system
<code>Spacks</code>	selected packages based on specified pattern
<code>URLs</code>	path and file name of HTML Help Page

Help pages are displayed in a separate browser window.

Note

The connection time for browsers (at least in Windows OS) is slow. If the HTML browser program is not already running, multiple matching pages will most likely not be displayed. However, subsequent calls to `showHelp` should show all matches.

See Also

[openFile](#), [setPBSext](#), [getPBSext](#)

showRes

*Show Results of Expression Represented by Text***Description**

Evaluate the supplied expression, reflect it on the command line, and show the results of the evaluation.

Usage

```
showRes(x, cr=TRUE, pau=TRUE)
```

Arguments

<code>x</code>	an R expression to evaluate
<code>cr</code>	logical: if TRUE, introduce extra carriage returns
<code>pau</code>	logical: if TRUE, pause after expression reflection and execution

Value

The results of the expression are return invisibly.

Examples

```
showRes("x=rnorm(100)", pau=FALSE)
```

showVignettes

*Display Vignettes for Packages***Description**

Create a GUI that displays all vignettes for installed packages. The user can choose to view the source file for building the vignette or the final .pdf file.

Usage

```
showVignettes(package)
```

Arguments

<code>package</code>	character string specifying package name that exists in the user's R library
----------------------	------------------------------------------------------------------------------

Details

If the argument `package` is not specified, the function will look for vignettes in all packages installed on the user's system. The user can choose to view the source file for building the vignette (usually *.Rnw or *.Snw files) or the final build from the source code (*.pdf).

`showVignettes` uses the **PBSmodelling** function `openFile` to display the .Rnw and .pdf files using programs that the system associates with these extensions. On systems that do not support file extension associations, the function `setPBSext` can temporarily set a command to associate with an extension.

See Also

[showHelp](#), [openFile](#), [setPBSext](#), [getPBSext](#)

sortHistory	<i>Sort an Active or Saved History</i>
-------------	----------------------------------------

Description

Utility to sort history. When called without any arguments, an interactive GUI is used to pick which history to sort. When called with `hisname`, sort this active history widget. When called with `file` and `outfile`, sort the history located in `file` and save to `outfile`.

Usage

```
sortHistory(file="", outfile=file, hisname="")
```

Arguments

<code>file</code>	file name of saved history to sort.
<code>outfile</code>	file to save sorted history to.
<code>hisname</code>	name of active history widget and window it is located in, given in the form <code>WINDOW.HISTORY</code> .

Details

After selecting a history to sort (either from given arguments, or interactive GUI) the R data editor window will be displayed. The editor will have one column named `new` which will have numbers 1,2,3,...,n. This represents the current ordering of the history. You may change the numbers around to define a new order. The list is sorted by reassigning the index in row `i` as index `i`.

For example, if the history had three items 1,2,3. Reordering this to 3,2,1 will reverse the order; changing the list to 1,2,1,1 will remove entry 3 and create two duplicates of entry 1.

See Also

`importHistory`, `initHistory`

testCol	<i>Display Named Colours Available Based on a Set of Strings</i>
---------	------------------------------------------------------------------

Description

Display colours as patches in a plot. Useful for programming purposes. Colours can be specified in any of 3 different ways: (i) by colour name, (ii) by hexadecimal colour code created by `rgb()`, or (iii) by an index to the `color()` palette.

Usage

```
testCol(cnam=colors()[sample(length(colors()),15)])
```

Arguments

<code>cnam</code>	vector of colour names to display. Defaults to 15 random names from the <code>color</code> palette.
-------------------	-----------------------------------------------------------------------------------------------------

See Also[pickCol](#)**Examples**

```
testCol(c("sky", "fire", "sea", "wood"))

testCol(c("plum", "tomato", "olive", "peach", "honeydew"))

testCol(substring(rainbow(63), 1, 7))

#display all colours set in the colour palette
testCol(1:length(palette()))

#they can even be mixed
testCol(c("#9e7ad3", "purple", 6))
```

testLty

*Display Line Types Available***Description**

Display line types available.

Usage

```
testLty(newframe = TRUE)
```

Arguments

`newframe` if TRUE, create a new blank frame, otherwise overlay current frame.

Note

Quick representation of first 20 line types for reference purposes.

testLwd

*Display Line Widths***Description**

Display line widths. User can specify particular ranges for `lwd`. Colours can also be specified and are internally repeated as necessary.

Usage

```
testLwd(lwd=1:20, col=c("black", "blue"), newframe=TRUE)
```

Arguments

`lwd` line widths to display. Ranges can be specified.
`col` colours to use for lines. Patterns are repeated if `length(lwd) > length(col)`
`newframe` if TRUE, create a new blank frame, otherwise overlay current frame.

Examples

```
testLwd(3:15,col=c("salmon","aquamarine","gold"))
```

testPch

Display Plotting Symbols and Backslash Characters

Description

Display plotting symbols. User can specify particular ranges (increasing continuous integer) for pch.

Usage

```
testPch(pch=1:100, ncol=10, grid=TRUE, newframe=TRUE, bs=FALSE)
```

Arguments

pch	symbol codes to view.
ncol	number of columns in display (can only be 2, 5, or 10). Most sensibly this is set to 10.
grid	logical: if TRUE, grid lines are plotted for visual aid.
newframe	logical: if TRUE reset the graph, otherwise overlay on top of the current graph.
bs	logical: if TRUE, show backslash characters used in text statements (e.g., 30°C).

Examples

```
testPch(123:255)
testPch(1:25,ncol=5)
testPch(41:277,bs=TRUE)
```

testWidgets

Display Sample GUIs and their Source Code

Description

Display an interactive GUI to demonstrate the available widgets in PBS Modelling. A text window displays the *window description file* source code. The user can modify this sample code and recreate the test GUI by pressing the button below.

The *Window Description Files* can be found in the R directory
`.../library/PBSmodelling/testWidgets`.

Usage

```
testWidgets()
```

Details

Following are the widgets and default values supported by PBS Modelling. For detailed descriptions, see Appendix A in ‘PBSModelling-UG.pdf’ located in the R directory `.../library/PBSmodelling/doc`.

```
button text="Calculate" font="" fg="black" bg="" width=0

unpackList

Unpack List Elements into Variables

Description

Make local or global variables (depending on the scope specified) from the named components of a list.

Usage

```
unpackList(x, scope="L")
```

Arguments

<code>x</code>	named list to unpack.
<code>scope</code>	If "L", create variables local to the parent frame that called the function. If "G", create global variables.

Value

A character vector of unpacked variable names.

See Also

[readList](#)

Examples

```

x <- list(a=21,b=23);
unpackList(x);
print(a);

```

vbdata

*Data: Lengths-at-Age for von Bertalanffy Curve***Description**

Lengths-at-age for freshwater mussels (*Anodonta kennerlyi*).

Usage

```
data(vbdata)
```

Format

A data frame with 16 rows and 2 columns `c("age", "len")`.

Details

Data for demonstration of the von Bertalanffy model used in the [calcMin](#) example.

Source

Fisheries and Oceans Canada - Mittertreiner and Schnute (1985)

References

Mittertreiner, A. and Schnute, J. (1985) Simplex: a manual and software package for easy nonlinear parameter estimation and interpretation in fishery research. *Canadian Technical Report of Fisheries and Aquatic Sciences* **1384**, xi + 90 pp.

vbpars

*Data: Initial Parameters for a von Bertalanffy Curve***Description**

Starting parameter values for `Linf`, `K`, and `t0` for von Bertalanffy minimization using length-at-age data ([vbdata](#)) for freshwater mussels (*Anodonta kennerlyi*).

Usage

```
data(vbpars)
```

Format

A matrix with 3 rows and 3 columns `c("Linf", "K", "t0")`. Each row contains the starting values, minima, and maxima, respectively, for the three parameters.

Details

Data for demonstration of the von Bertalanffy model used in the [calcMin](#) example.

References

Mittertreiner, A. and Schnute, J. (1985) Simplex: a manual and software package for easy nonlinear parameter estimation and interpretation in fishery research. *Canadian Technical Report of Fisheries and Aquatic Sciences* **1384**, xi + 90 pp.

view

View First/Last/Random n Elements/Rows of an Object

Description

View the first or last or random *n* elements or rows of an object. Components of lists will be subset also.

Usage

```
view(obj, n=5, last=FALSE, random=FALSE, ...)
```

Arguments

<i>obj</i>	object to view.
<i>n</i>	first (default)/last/random <i>n</i> elements/rows of <i>obj</i> to view.
<i>last</i>	logical: if TRUE, last <i>n</i> elements/rows of <i>obj</i> are displayed.
<i>random</i>	logical: if TRUE, <i>n</i> random elements/rows (without replacement) of <i>obj</i> are displayed.
<i>...</i>	additional arguments (e.g., <i>replace=T</i> if specifying <i>random=T</i>).

writeList

Write a List to a File in PBS Modelling Format

Description

Write an ASCII text representation in either "D" format or "P" format. The "D" format makes use of `dput` and `dget`, and produces an R representation of the list. The "P" format represents a simple list in an easy-to-read, ad hoc PBSmodelling format.

Usage

```
writeList(x, fname, format="D", comments="")
```

Arguments

<i>x</i>	R list object to write to an ASCII text file.
<i>fname</i>	file name of the text file containing the list.
<i>format</i>	format of the file to create: "D" or "P".
<i>comments</i>	vector of character strings to use as initial-line comments in the file.

Details

The "D" format is equivalent to using R's base functions `dput` and `dget`, which support all R objects.

The "P" format only supports named lists of vectors, matrices, and data frames. Scalars are treated like vectors. Nested lists are not supported.

The "P" format writes each named element in a list using the following conventions: (i) \$ followed by the name of the data object to denote the start of that object's description; (ii) \$\$ on the next line to describe the object's structure - object type, mode(s), names (if vector), rownames (if matrix or data), and colnames (if matrix or data); and (iii) subsequent lines of data (one line for vector, multiple lines for matrix or data).

Multiple rows of data for matrices or data frames must have equal numbers of entries (separated by whitespace).

For complete details, see "PBSmodelling-UG.pdf" in the R directory `.../library/PBSmodelling/doc`.

[readList](#), [openFile](#)

Examples

```
## Not run:
test <- list(a=10,b=euro,c=view(WorldPhones),d=view(USArrests))
writeList(test,"test.txt",format="P",
          comments=" Scalar, Vector, Matrix, Data Frame")
openFile("test.txt")
## End(Not run)
```

writePBSoptions	<i>Write PBS Options to an External File</i>
-----------------	----------------------------------------------

Description

Save options that were set using `setPBSoptions`, `setPBSext`, or interfaces such as `loadC`. These options can be reloaded using `readPBSoptions`.

Usage

```
writePBSoptions(fname="PBSoptions.txt")
```

Arguments

`fname` file name or full path of file to which the options will be saved.

Note

Options with names starting with ". " will not be saved.
