

# Package ‘arm’

May 30, 2007

**Version** 1.0-19

**Date** 2007-5-30

**Title** Data Analysis Using Regression and Multilevel/Hierarchical Models

**Author** Andrew Gelman <gelman@stat.columbia.edu>, Yu-Sung Su <ys463@columbia.edu>, Jennifer Hill <jh1030@columbia.edu>, Maria Grazia Pittau <grazia@stat.columbia.edu>, Jouni Kerman <jouni@kerman.com> and Tian Zheng <tzheng@stat.columbia.edu>

**Maintainer** Yu-Sung Su <ys463@columbia.edu>

**Depends** methods, R (>= 2.4.0), MASS, Matrix (>= 0.9975-1), lme4 (>= 0.9975-1), R2WinBUGS

**Suggests** car, foreign, nnet

**Description** R functions for processing lm, glm, mer and polr outputs.

**URL** <http://www.stat.columbia.edu/~gelman/software/>

**License** GPL (version 2 or later)

balanceplot

*Plot of Balance Statistics***Description**

This function plots the balance statistics before and after matching.

**Usage**

```
balanceplot(matched, pscore.fit,
             longcovnames = NULL,
             main = "Standardized Difference in Means",
             cex.main = 1, cex.vars = 0.8, cex.pts = 0.8,
             mar = c(0, 5, 4, 2), mgp = c(2, 0.25, 0),
             oma = c(0, 0, 0, 0), tcl = -0.2, ...)
```

**Arguments**

|              |   |
|--------------|---|
| matched      | matched data using matching function, see the example below.                            |
| pscore.fit   | glm.fit object to get propensity scores.  |
| longcovnames | long covariate names. If not provided, plot will use covariate variable name by default |
| main         | title of the plot   |
| cex.main     | font size of main title   |
| cex.vars     | font size of variabel names   |
| cex.pts      | point size of the estimates   |
| mar          | margin of the plot, see ?par for details  |
| mgp          | axis margin of the plot, see ?par for details   |
| oma          | outer margin of the plot, see ?par for details  |
| tcl          | length of ticks, see ?par for details   |
| ...          | other plot options may be passed to this function                                       |

**Details**

This function plots the balance statistics before and after matching. The open circle dots represent the unmatched balance statistics. The solid dots represent the matched balance statistics. The closer the value of the estimates to the zero, the better the treated and control groups are balanced after matching.

**Note**

The function does not work with predictors that contain factor(x), log(x) or all other data transformation. Create new objects for these variables. Attach them into the original dataset before doing the matching procedure.

bayesglm

*Bayesian generalized linear models.*

---

## Description

Bayesian functions for generalized linear modeling with independent normal, t, or Cauchy prior distribution for the coefficients.

## Usage

```
bayesglm (formula, family = gaussian, data,
          weights, subset, na.action,
          start = NULL, etastart, mustart,
          offset, control = glm.control(...),
          model = TRUE, method = "glm.fit",
          x = FALSE, y = TRUE, contrasts = NULL,
          prior.mean = 0, prior.scale = 2.5,
          prior.scale.for.intercept = 10,
          prior.df = 1, min.prior.scale=1e-12,
          scaled = TRUE, n.iter = 100, ...)

bayesglm.fit (x, y, weights = rep(1, nobs),
              start = NULL, etastart = NULL,
              mustart = NULL, offset = rep(0, nobs), family = gaussian(),
              control = glm.control(), intercept = TRUE,
              prior.mean = 0, prior.scale = 2.5,
              prior.scale.for.intercept = 10,
              prior.df = 1, min.prior.scale=1e-12, scaled = TRUE)
```

**Arguments**

|                          |   |
|--------------------------|---|
| <code>formula</code>     | a symbolic description of the model to be fit. The details of model specification are given below.  |
| <code>family</code>      | a description of the error distribution and link function to be used in the model. This can be a character string naming a family function, a family function or the result of a call to a family function. (See <a href="#">family</a> for details of family functions.)   |
| <code>data</code>        | an optional data frame, list or environment (or object coercible by <code>as.data.frame</code> to a data frame) containing the variables in the model. If not found in <code>data</code> , the variables are taken from <code>environment(formula)</code> , typically the environment from which <code>glm</code> is called.  |
| <code>weights</code>     | an optional vector of weights to be used in the fitting process. Should be <code>NULL</code> or a numeric vector.   |
| <code>subset</code>      | an optional vector specifying a subset of observations to be used in the fitting process.   |
| <code>na.action</code>   | a function which indicates what should happen when the data contain NAs. The default is set by the <code>na.action</code> setting of <code>options</code> , and is <code>na.fail</code> if that is unset. The “factory-fresh” default is <code>na.omit</code> . Another possible value is <code>NULL</code> , no action. Value <code>na.exclude</code> can be useful.                                     |
| <code>start</code>       | starting values for the parameters in the linear predictor.   |
| <code>etastart</code>    | starting values for the linear predictor.   |
| <code>mustart</code>     | starting values for the vector of means.  |
| <code>offset</code>      | this can be used to specify an <i>a priori</i> known component to be included in the linear predictor during fitting. This should be <code>NULL</code> or a numeric vector of length either one or equal to the number of cases. One or more <code>offset</code> terms can be included in the formula instead or as well, and if both are specified their sum is used. See <a href="#">model.offset</a> . |
| <code>control</code>     | a list of parameters for controlling the fitting process. See the documentation for <a href="#">glm.control</a> for details.  |
| <code>model</code>       | a logical value indicating whether <i>model frame</i> should be included as a component of the returned value.  |
| <code>method</code>      | the method to be used in fitting the model. The default method <code>"glm.fit"</code> uses iteratively reweighted least squares (IWLS). The only current alternative is <code>"model.frame"</code> which returns the model frame and does no fitting.   |
| <code>x, y</code>        | For <code>glm</code> : logical values indicating whether the response vector and model matrix used in the fitting process should be returned as components of the returned value.<br>For <code>glm.fit</code> : <code>x</code> is a design matrix of dimension $n \times p$ , and <code>y</code> is a vector of observations of length <code>n</code> .   |
| <code>contrasts</code>   | an optional list. See the <code>contrasts.arg</code> of <code>model.matrix.default</code> .   |
| <code>intercept</code>   | logical. Should an intercept be included in the <i>null</i> model?  |
| <code>prior.mean</code>  | prior mean for the coefficients: default is 0. Can be a vector of length equal to the number of predictors (including the intercept, if any). If it is a scalar, it is expanded to the length of this vector.   |
| <code>prior.scale</code> | prior scale for the coefficients: default is 2.5. Can be a vector of length equal to the number of predictors (including the intercept, if any). If it is a scalar, it is expanded to the length of this vector.  |

|  |   |
|--|---|
| <code>prior.scale.for.intercept</code> | prior scale for the intercept: default is 10.   |
| <code>prior.df</code>                  | for t distribution: default is 1 (Cauchy). Set to Inf to get normal prior distributions. Can be a vector of length equal to the number of predictors (including the intercept, if any). If it is a scalar, it is expanded to the length of this vector. |
| <code>min.prior.scale</code>           | Minimum prior scale for the coefficients: default is 1e-12.   |
| <code>scaled</code>                    | if scaled = TRUE, then the prior distribution is rescaled: default is TRUE  |
| <code>n.iter</code>                    | default is 100.   |
| <code>...</code>                       | further arguments passed to or from other methods.  |

## Details

The program is a simple alteration of `glm()` that uses an approximate EM algorithm to update the betas at each step using an augmented regression to represent the prior information.

We use Student-t prior distributions for the coefficients. The prior distribution for the constant term is set so it applies to the value when all predictors are set to their mean values.

If scaled=TRUE, the scales for the prior distributions of the coefficients are determined as follows: For a predictor with only one value, we just use `prior.scale`. For a predictor with two values, we use `prior.scale/range(x)`. For a predictor with more than two values, we use `prior.scale/(2*sd(x))`.

We include all the `glm()` arguments but we haven't tested that all the options (e.g., `offsets`, `contrasts`, `deviance` for the null model) all work.

The new arguments here are: `prior.mean`, `prior.scale`, `prior.scale.for.intercept`, `prior.df`, and `scaled`.

## Value

See `glm` for details.

## Examples

```
n <- 100
x1 <- rnorm (n)
x2 <- rbinom (n, 1, .5)
b0 <- 1
b1 <- 1.5
b2 <- 2
```

```

y <- rbinom (n, 1, invlogit(b0+b1*x1+b2*x2))

M1 <- glm (y ~ x1 + x2, family=binomial(link="logit"))
display (M1)

M2 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=Inf, prior.df=Inf)
display (M2) # just a test: this should be identical to classical logit

M3 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"))
# default Cauchy prior with scale 2.5
display (M3)

M4 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=2.5, prior.df=1)
# Same as M3, explicitly specifying Cauchy prior with scale 2.5
display (M4)

M5 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=2.5, prior.df=7) # t_7 prior with scale 2.5
display (M5)

M6 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=2.5, prior.df=Inf) # normal prior with scale 2.5
display (M6)

# Create separation: set y=1 whenever x2=1
# Now it should blow up without the prior!

y <- ifelse (x2==1, 1, y)

M1 <- glm (y ~ x1 + x2, family=binomial(link="logit"))
display (M1)

M2 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=Inf, prior.df=Inf) # Same as M1
display (M2)

M3 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"))
display (M3)

M4 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=2.5, prior.df=1) # Same as M3
display (M4)

M5 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=2.5, prior.df=7)
display (M5)

M6 <- bayesglm (y ~ x1 + x2, family=binomial(link="logit"),
  prior.scale=2.5, prior.df=Inf)
display (M6)

# bayesglm with gaussian family (bayes lm)
sigma <- 5
y2 <- rnorm (n, b0+b1*x1+b2*x2, sigma)
M7 <- bayesglm (y2 ~ x1 + x2, prior.scale=Inf, prior.df=Inf)

```

```
display (M7)
```

---

 bayespolr

*Bayesian Ordered Logistic or Probit Regression*

---

## Description

Bayesian functions for ordered logistic or probit modeling with independent normal, t, or Cauchy prior distribution for the coefficients.

## Usage

```
bayespolr(formula, data, weights, start, ...,
  subset, na.action, contrasts = NULL,
  Hess = TRUE, model = TRUE,
  method = c("logistic", "probit", "cloglog", "cauchit"),
  drop.unused.levels=TRUE,
  prior.mean = 0, prior.scale = 2.5, prior.df = 1,
  scaled = TRUE, prior.mean.for.cutpoints = 0,
  prior.scale.for.cutpoints = 10, prior.df.for.cutpoints = 1,
  n.iter = 100)
```

## Arguments

|                    |  |
|--------------------|--|
| formula            | a formula expression as for regression models, of the form 'response predictors'. The response should be a factor (preferably an ordered factor), which will be interpreted as an ordinal response, with levels ordered as in the factor. A proportional odds model will be fitted. The model must have an intercept: attempts to remove one will lead to a warning and be ignored. An offset may be used. See the documentation of 'formula' for other details. |
| data               | an optional data frame in which to interpret the variables occurring in 'formula'.   |
| weights            | optional case weights in fitting. Default to 1.  |
| start              | initial values for the parameters. This is in the format 'c(coefficients, zeta)'   |
| ...                | additional arguments to be passed to 'optim', most often a 'control' argument.   |
| subset             | expression saying which subset of the rows of the data should be used in the fit. All observations are included by default.  |
| na.action          | a function to filter missing data.   |
| contrasts          | a list of contrasts to be used for some or all of the factors appearing as variables in the model formula.   |
| Hess               | logical for whether the Hessian (the observed information matrix) should be returned.  |
| model              | logical for whether the model matrix should be returned.   |
| method             | logistic or probit or complementary log-log or cauchit (corresponding to a Cauchy latent variable and only available in R >= 2.1.0).   |
| drop.unused.levels | default TRUE, if FALSE, it interpolates the intermediate values if the data have integer levels.   |

|  |   |
|--|---|
| <code>prior.mean</code>                | prior mean for the coefficients: default is 0. Can be a vector of length equal to the number of predictors (not counting the intercepts). If it is a scalar, it is expanded to the length of this vector.   |
| <code>prior.scale</code>               | prior scale for the coefficients: default is 2.5. Can be a vector of length equal to the number of predictors (not counting the intercepts). If it is a scalar, it is expanded to the length of this vector.  |
| <code>prior.df</code>                  | for t distribution: default is 1 (Cauchy). Set to Inf to get normal prior distributions. Can be a vector of length equal to the number of predictors (not counting the intercepts). If it is a scalar, it is expanded to the length of this vector. |
| <code>scaled</code>                    | if <code>scaled = TRUE</code> , then the prior distribution is rescaled. Can be a vector of length equal to the number of cutpoints (intercepts). If it is a scalar, it is expanded to the length of this vector.                                   |
| <code>prior.mean.for.cutpoints</code>  | prior mean for cutpoints: default is 0. Can be a vector of length equal to the number of cutpoints (intercepts). If it is a scalar, it is expanded to the length of this vector.  |
| <code>prior.scale.for.cutpoints</code> | prior scale for cutpoints: default is 10. Can be a vector of length equal to the number of cutpoints (intercepts). If it is a scalar, it is expanded to the length of this vector.  |
| <code>prior.df.for.cutpoints</code>    | for t distribution: default is 1 (Cauchy). Can be a vector of length equal to the number of cutpoints (intercepts). If it is a scalar, it is expanded to the length of this vector.   |
| <code>n.iter</code>                    | default is 100.   |

## Details

The program is a simple alteration of `polr` in VR version 7.2-31 that augments the loglikelihood with the log of the t prior distributions for the coefficients.

We use Student-t prior distributions for the coefficients. The prior distributions for the intercepts (the cutpoints) are set so they apply to the value when all predictors are set to their mean values.

If `scaled=TRUE`, the scales for the prior distributions of the coefficients are determined as follows: For a predictor with only one value, we just use `prior.scale`. For a predictor with two values, we use `prior.scale/range(x)`. For a predictor with more than two values, we use `prior.scale/(2*sd(x))`.

## Value

See `polr` for details.

```

binnedplot

*Binned Residual Plot***Description**

A function that plots averages of y versus averages of x and can be useful to plot residuals for logistic regression.

**Usage**

```

binnedplot(x ,y, nclass=floor(sqrt(length(x))),
  xlab="Expected Values", ylab="Average residual",
  main="Binned residual plot",
  cex.pts=0.8, col.pts=1, col.int="gray")

```

**Arguments**

|         |  |
|---------|--|
| x       | The expected values from the logistic regression.  |
| y       | The residuals values from logistic regression (observed values minus expected values).                                     |
| nclass  | Number of categories (bins) based on their fitted values in which the data are divided, default is floor(sqrt(length(x))). |
| xlab    | a label for the x axis, default is "Expected Values".  |
| ylab    | a label for the y axis, default is "Average residual".   |
| main    | a main title for the plot, default is "Binned residual plot". See also <code>title</code> .                                |
| cex.pts | The size of points, default=0.8.   |
| col.pts | color of points, default is black  |
| col.int | color of intervals, default is gray  |

## Details

In logistic regression, as with linear regression, the residuals can be defined as observed minus expected values. The data are discrete and so are the residuals. As a result, plots of raw residuals from logistic regression are generally not useful. The binned residuals plot instead, after dividing the data into categories (bins) based on their fitted values, plots the average residual versus the average fitted value for each bin.

## Value

A plot in which the gray lines indicate  $\pm 2$  standard-error bounds, within which one would expect about 95% of the binned residuals to fall, if the model were actually true.

## Note

There is typically some arbitrariness in choosing the number of bins: each bin should contain enough points so that the averaged residuals are not too noisy, but it helps to have also many bins so as to see more local patterns in the residuals (see Gelman and Hill, Data Analysis Using Regression and Multilevel/Hierarchical Models, pag 97).

coefplot

---

*Generic Function for Making Coefficient Plot*

---

## Description

Functions that plot the coefficients  $\pm 1$  and  $2$  sd from a lm, glm, bugs, and polr fits.

**Usage**

```
coefplot(object, ...)

coefplot.default(coefs, sds,
                 varnames=NULL, CI=2, vertical=TRUE,
                 xlim=NULL, ylim=NULL,
                 xlab="", ylab="", main="",
                 cex.var=0.8, cex.pts=0.9, col.pts=1,
                 var.las=2)

# methods for coefplot()
coefplot.lm(object, varnames=NULL, intercept=FALSE, ...)
coefplot.glm(object, varnames=NULL, intercept=FALSE, ...)
coefplot.polr(object, varnames=NULL, ...)
coefplot.bugs(object, varnames=NULL, CI=2,
              xlim=NULL, ylim=NULL,
              xlab="", ylab="", main="",
              cex.var=0.8, cex.pts=0.9, col.pts=1)
```

**Arguments**

|                        |   |
|------------------------|---|
| <code>object</code>    | fitted objects-lm, glm, bugs and polr, or a vector of coefficients.   |
| <code>...</code>       | further arguments passed to or from other methods.  |
| <code>coefs</code>     | a vector of coefficients.   |
| <code>sds</code>       | a vector of sds of coefficients.  |
| <code>varnames</code>  | a vector of variable names, default is NULL, which will use the names of variables.   |
| <code>CI</code>        | confidence interval, default is 2, which will plot $\pm 2$ sds or 95% CI. If CI=1, plot $\pm 1$ sds or 50% CI instead.                            |
| <code>vertical</code>  | orientation of the plot, default is TRUE which will plot variable names in the 2nd axis. If FALSE, plot variable names in the first axis instead. |
| <code>xlim</code>      | the x limits (x1, x2) of the plot. Note that ' $x1 > x2$ ' is allowed and leads to a "reversed axis".   |
| <code>ylim</code>      | the y limits of the plot.   |
| <code>xlab</code>      | a label for the x axis, default is "".  |
| <code>ylab</code>      | a label for the y axis, default is "".  |
| <code>main</code>      | a main title for the plot, default is "". See also <code>title</code> .   |
| <code>cex.var</code>   | The fontsize of the variable names, default=0.8.  |
| <code>cex.pts</code>   | The size of data points, default=0.9.   |
| <code>col.pts</code>   | color of points and segments, default is black.   |
| <code>var.las</code>   | the orientation of variable names against the axis, default is 2. see the usage of <code>las</code> in <a href="#">par</a> .                      |
| <code>intercept</code> | If TRUE will plot intercept, default=FALSE to get better presentation.  |

**Details**

This function plots coefficients from lm, glm and polr with 1 sd and 2 sd interval bars.

**Value**

Plot of the coefficients from a `lm` or `glm` fit. You can add the intercept, the variable names and the display the result of the fitted model.

**Author(s)**

corrplot

---

*Correlation Plot*

---

## Description

Function for making a correlation plot starting from a data matrix

**Usage**

```
corrplot (data, varnames=NULL, cutpts=NULL,
          abs=TRUE, details=TRUE,
          n.col.legend=5, cex.col=0.7,
          cex.var=0.9, digits=1, color=FALSE)
```

**Arguments**

|                           |  |
|---------------------------|--|
| <code>data</code>         | a data matrix  |
| <code>varnames</code>     | variable names of the data matrix, if not provided use default variable names  |
| <code>abs</code>          | if TRUE, transform all correlation values into positive values, default=TRUE.  |
| <code>cutpts</code>       | a vector of cutting points for color legend, default is NULL. The function will decide the cutting points if cutpts is not assigned. |
| <code>details</code>      | show more than one digits correlaton values. Default is TRUE. FALSE is suggested to get readable output.                             |
| <code>n.col.legend</code> | number of legend for the color thermometer.  |
| <code>cex.col</code>      | font size of the color thermometer.  |
| <code>cex.var</code>      | font size of the variable names.   |
| <code>digits</code>       | number of digits shown in the text of the color theromoeter.   |
| <code>color</code>        | color of the plot, default is FALSE, which uses gray scale.  |

**Details**

The function adapts the R function for Figure 8 in Tian Zheng, Matthew Salganik, and Andrew Gelman, 2006, "How many people do you know in prison?: using overdispersion in count data to estimate social structure in networks", Journal of the American Statistical Association, Vol.101, NO. 474: p.409-23.

**Value**

A correlation plot.

**Note**

display

*Functions for Processing lm, glm, mer and polr Output***Description**

This generic function gives a clean printout of lm, glm, mer and polr objects.

**Usage**

```

display (object, ...)

# methods for display()
display.lm (object, digits=2)
display.glm (object, digits=2)
display.mer (object, digits=2)
display.polr (object, digits=2)

```

**Arguments**

|        |  |
|--------|--|
| object | The output of a call to lm, glm, mer, polr, or related regressions function with n data points and k predictors. |
| ...    | further arguments passed to or from other methods.   |
| digits | number of significant digits to display.   |

**Details**

This generic function gives a clean printout of `lm`, `glm`, `mer` and `polr` objects, focusing on the most pertinent pieces of information: the coefficients and their standard errors, the sample size, number of predictors, residual standard deviation, and R-squared. Note: R-squared is automatically displayed to 2 digits, and deviances are automatically displayed to 1 digit, no matter what.

**Value**

Coefficients and their standard errors, the sample size, number of predictors, residual standard deviation, and R-squared

**Note**

Output are the model, the regression coefficients and standard errors, and the residual sd and R-squared (for a linear model), or the null deviance and residual deviance (for a generalized linear model).

```
# Here's a simple example of a model of the form,  $y = a + bx + \text{error}$ ,
# with 10 observations in each of 10 groups, and with both the
# intercept and the slope varying by group. First we set up the model and data.

group <- rep(1:10, rep(10,10))
mu.a <- 0
sigma.a <- 2
mu.b <- 3
sigma.b <- 4
rho <- 0
Sigma.ab <- array (c(sigma.a^2, rho*sigma.a*sigma.b,
                    rho*sigma.a*sigma.b, sigma.b^2), c(2,2))

sigma.y <- 1
ab <- mvrnorm (10, c(mu.a,mu.b), Sigma.ab)
a <- ab[,1]
b <- ab[,2]

#
x <- rnorm (100)
y1 <- rnorm (100, a[group] + b[group]*x, sigma.y)
y2 <- rbinom(100, 1, prob=invlogit(a[group] + b*x))

#
```

```

# display a simple linear model
#
M1 <- lm (y1 ~ x)
display (M1)

#
# display a simple logit model
#
M2 <- glm (y2 ~ x, family=binomial(link="logit"))
display (M2)

#
# Then fit and display a simple varying-intercept model:
#
M3 <- lmer (y1 ~ x + (1|group))
display (M3)
M3.sim <- mcsamp (M3)
print (M3.sim)
plot (M3.sim)

#
# Then the full varying-intercept, varying-slope model:
#
M4 <- lmer (y1 ~ x + (1 + x |group))
display (M4)
M4.sim <- mcsamp (M4)
print (M4.sim)
plot (M4.sim)

#
# Then the full varying-intercept, logit model:
#
M5 <- lmer (y2 ~ x + (1|group), family=binomial(link="logit"))
display (M5)
M5.sim <- mcsamp (M5)
print (M5.sim)
plot (M5.sim)

#
# Then the full varying-intercept, varying-slope logit model:
#
M6 <- lmer (y2 ~ x + (1 + x |group), family=binomial(link="logit"))
display (M6)
M6.sim <- mcsamp (M6)
print (M6.sim)
plot (M6.sim)

#
# Then the ordered logit model from polr
#

display(M7)

M8 <- bayespolr(Sat ~ Infl + Type + Cont, weights = Freq, data = housing)
display(M8)

```

**Description**

A function that like `source()` but recalls the last source file names by default.

**Usage**

```
go(..., add=FALSE, timer=FALSE)
```

**Arguments**

|                    |  |
|--------------------|--|
| <code>...</code>   | list of filenames as character strings.                      |
| <code>add</code>   | add these names to the current list? if replace, then FALSE. |
| <code>timer</code> | time the execution time of <code>go()</code> .               |

**Author(s)**

Jouni Kerman (jouni@kerman.com) (kerman@stat.columbia.edu)

**Examples**

```
go('myprog')           # will run source('myprog.r')
go()                   # will run source('myprog.r') again
go('somelib',add=TRUE) # will run source('myprog.r') and source('somelib.r')
go('myprog','somelib') # same as above
go('mytest')           # will run source('mytest') only
go()                   # runs source('mytest') again
G                       # short cut to call go()
```

---

invlogit

*Inverse logistic function*

---

**Description**

Inverse-logit function, transforms continuous values to the range (0, 1)

**Usage**

```
invlogit(x)
```

**Arguments**

|                |                               |
|----------------|-------------------------------|
| <code>x</code> | A vector of continuous values |
|----------------|-------------------------------|

**Details**

The Inverse-logit function defined as:  $\text{logit}^{-1}(x) = e^x / (1 + e^x)$  transforms continuous values to the range (0, 1), which is necessary, since probabilities must be between 0 and 1 and maps from the linear predictor to the probabilities

**Value**

A vector of estimated probabilities

**Author(s)**

x2 <- rbinom (n, 1, .5)
b0 <- 1
b1 <- 1.5
b2 <- 2
Inv.logit <- invlogit (b0+b1*x1+b2*x2)
plot(b0+b1*x1+b2*x2, Inv.logit)
```

---

lalonge

*Lalonge Dataset*

---

**Description**

Dataset used by Dehejia and Wahba (1999) to evaluate propensity score matching.

**Usage**

```
data(lalonge)
```

**Format**

A data frame with 445 observations on the following 12 variables.

**age** age in years.

**educ** years of schooling.

**black** indicator variable for blacks.

**hisp** indicator variable for Hispanics.

**married** indicator variable for marital status.

**nodegr** indicator variable for high school diploma.

**re74** real earnings in 1974.

**re75** real earnings in 1975.

**re78** real earnings in 1978.

**u74** indicator variable for earnings in 1974 being zero.

**u75** indicator variable for earnings in 1975 being zero.

**treat** an indicator variable for treatment status.

## Details

Two demos are provided which use this dataset. The first, `DehejiaWahba`, replicates one of the models from Dehejia and Wahba (1999). The second demo, `AbadieImbens`, replicates the models produced by Abadie and Imbens [http://elsa.berkeley.edu/~imbens/matlab/lalonde\\_exper\\_04feb2.m](http://elsa.berkeley.edu/~imbens/matlab/lalonde_exper_04feb2.m). Many of these models are found to produce good balance for the Lalonde data.

## Note

This documentation is adapted from `Matching` package.

|-----------------------|-----------------|
| <code>matching</code> | <i>Matching</i> |
|-----------------------|-----------------|

---

## Description

Function for processing matching with propensity score

## Usage

```
matching(z, score)
```

## Arguments

|                    |   |
|--------------------|---|
| <code>z</code>     | vector of indicators for treatment or control.                        |
| <code>score</code> | vector of the propensity scores in the same order as <code>z</code> . |

## Details

Function for matching each treatment unit in turn the control unit (not previously chosen) with the closest propensity score

## Value

The function returns a vector of indices that the corresponding unit is matched to. 0 means matched to nothing.

---

mcsamp

---

*Quick Function to Run mcmcsamp() in lme4*

---

**Description**

The quick function for MCMC sampling for lmer and glmer objects and convert to Bugs objects for easy display.

**Usage**

```
mcsamp (object, n.chains=3, n.iter=1000,
        n.burnin=floor(n.iter/2), n.thin=1,
        saveb=TRUE, make.bugs.object=TRUE)
```

**Arguments**

|                  |  |
|------------------|--|
| object           | lmer or glmer objects  |
| n.chains         | number of MCMC chains  |
| n.iter           | number of iteration for each MCMC chain  |
| n.burnin         | number of burnin for each MCMC chain   |
| n.thin           | number of thin for each MCMC chain   |
| saveb            | if 'TRUE', causes the values of the random effects in each sample to be saved. |
| make.bugs.object | tranform the output into bugs object, default is TRUE                          |

## Details

This function generates a sample from the posterior distribution of the parameters of a fitted model using Markov Chain Monte Carlo methods. It automatically simulates multiple sequences and allows convergence to be monitored. The function relies on `mcmc` in `lme4`.

## Value

An object of (S3) class `"bugs"` suitable for use with the functions in the "R2WinBUGS" package.

## Author(s)

## Examples

```
# Here's a simple example of a model of the form,  $y = a + bx + \text{error}$ ,
# with 10 observations in each of 10 groups, and with both the intercept
# and the slope varying by group. First we set up the model and data.
#
group <- rep(1:10, rep(10,10))
mu.a <- 0
sigma.a <- 2
mu.b <- 3
sigma.b <- 4
rho <- 0
Sigma.ab <- array (c(sigma.a^2, rho*sigma.a*sigma.b,
                    rho*sigma.a*sigma.b, sigma.b^2), c(2,2))
sigma.y <- 1
ab <- mvrnorm (10, c(mu.a,mu.b), Sigma.ab)
a <- ab[,1]
b <- ab[,2]
#
x <- rnorm (100)
y1 <- rnorm (100, a[group] + b[group]*x, sigma.y)
y2 <- rbinom(100, 1, prob=invlogit(a[group] + b*x))
#
# Then fit and display a simple varying-intercept model:

M1 <- lmer (y1 ~ x + (1|group))
display (M1)
M1.sim <- mcsamp (M1)
print (M1.sim)
plot (M1.sim)
#
# Then the full varying-intercept, varying-slope model:
```

```
#
M2 <- lmer (y1 ~ x + (1 + x |group))
display (M2)
M2.sim <- mcsamp (M2)
print (M2.sim)
plot (M2.sim)

#
# Then the full varying-intercept, logit model:
#
M3 <- lmer (y2 ~ x + (1|group), family=binomial(link="logit"))
display (M3)
M3.sim <- mcsamp (M3)
print (M3.sim)
plot (M3.sim)

#
# Then the full varying-intercept, varying-slope logit model:
#
M4 <- lmer (y2 ~ x + (1 + x |group), family=binomial(link="logit"))
display (M4)
M4.sim <- mcsamp (M4)
print (M4.sim)
plot (M4.sim)
```

rescale

*Function for Standardizing by Centering and Dividing by 2 sd's***Description**

This function standardizes a variable by centering and dividing by 2 sd's with exceptions for binary variables.

**Usage**

```
rescale(x, binary.inputs)
```

**Arguments**

`x` a vector  
`binary.inputs` options for standardizing binary variables

**Value**

the standardized vector

rescale(y, "center")
```

---

se.coef

---

*Extract Standard Errors of Model Coefficients*

---

**Description**

These functions extract standard errors of model coefficients from objects returned by modeling functions.

**Usage**

```
se.coef (object)
se.fixef (object)
se.ranef (object)

# methods for se.coef()
se.coef.lm (object)
se.coef.glm (object)
se.coef.mer (object)
```

**Arguments**

object                      object of lm, glm, lmer and glmer fit

**Details**

se.coef extracts standard errors from objects returned by modeling functions. se.fixef extracts standard errors of the fixed effects from objects returned by lmer and glmer functions. se.ranef extracts standard errors of the random effects from objects returned by lmer and glmer functions.

**Value**

se.coef gives lists of standard errors for coef, se.fixef gives a vector of standard errors for fixef and se.ranef gives a list of standard errors for ranef.

**Author(s)**

Andrew Gelman [⟨gelman@stat.columbia.edu⟩](mailto:gelman@stat.columbia.edu); Yu-Sung Su [⟨ys463@columbia.edu⟩](mailto:ys463@columbia.edu)

**Examples**

```
# Here's a simple example of a model of the form,  $y = a + bx + \text{error}$ ,
# with 10 observations in each of 10 groups, and with both the
# intercept and the slope varying by group. First we set up the model and data.

group <- rep(1:10, rep(10,10))
mu.a <- 0
sigma.a <- 2
mu.b <- 3
sigma.b <- 4
rho <- 0
Sigma.ab <- array (c(sigma.a^2, rho*sigma.a*sigma.b,
                    rho*sigma.a*sigma.b, sigma.b^2), c(2,2))

sigma.y <- 1
ab <- mvrnorm (10, c(mu.a,mu.b), Sigma.ab)
a <- ab[,1]
b <- ab[,2]

#
x <- rnorm (100)
y1 <- rnorm (100, a[group] + b[group]*x, sigma.y)
y2 <- rbinom(100, 1, prob=invlogit(a[group] + b*x))

# lm fit
M1 <- lm (y1 ~ x)
se.coef (M1)

# glm fit
M2 <- glm (y2 ~ x)
se.coef (M2)

# lmer fit
M3 <- lmer (y1 ~ x + (1 + x |group))
se.coef (M3)
se.fixef (M3)
se.ranef (M3)

# glmer fit
M4 <- lmer (y2 ~ 1 + (0 + x |group), family=binomial(link="logit"))
se.coef (M4)
se.fixef (M4)
se.ranef (M4)
```

sigma.hat

*Extract Residual Errors***Description**

This generic function extracts residual errors from a fitted model.

**Usage**

```
sigma.hat(object)

# methods for sigma.hat()
sigma.hat.lm (object)
sigma.hat.glm (object)
sigma.hat.mer (object)
```

**Arguments**

object                    any fitted model object of lm, glm and mer class

**Author(s)**

Andrew Gelman <gelman@stat.columbia.edu>; Yu-Sung Su <ys463@columbia.edu>

**See Also**

[display](#), [summary](#), [lm](#), [glm](#), [lmer](#)

**Examples**

```
group <- rep(1:10, rep(10,10))
mu.a <- 0
sigma.a <- 2
mu.b <- 3
sigma.b <- 4
rho <- 0
Sigma.ab <- array (c(sigma.a^2, rho*sigma.a*sigma.b,
                    rho*sigma.a*sigma.b, sigma.b^2), c(2,2))

sigma.y <- 1
ab <- mvrnorm (10, c(mu.a,mu.b), Sigma.ab)
a <- ab[,1]
b <- ab[,2]

x <- rnorm (100)
y1 <- rnorm (100, a[group] + b[group]*x, sigma.y)
y2 <- rbinom(100, 1, prob=invlogit(a[group] + b*x))

M1 <- lm (y1 ~ x)
sigma.hat(M1)

M2 <- bayesglm (y1 ~ x, prior.scale=Inf, prior.df=Inf)
sigma.hat(M2) # should be same to sigma.hat(M1)

M3 <- glm (y2 ~ x, family=binomial(link="logit"))
```

```

sigma.hat(M3)

M4 <- lmer (y1 ~ (1+x|group))
sigma.hat(M4)

M5 <- lmer (y2 ~ (1+x|group), family=binomial(link="logit"))
sigma.hat(M5)

```

sim

*Functions to Get Posterior Distributions***Description**

This generic function gets posterior simulations of sigma and beta from a lm object, or simulations of beta from a glm object, or simulations of beta from a mer object

**Usage**

```

sim(object, ...)

# methods for sim()
sim.lm (object, n.sims = 100)
sim.glm (object, n.sims = 100)
sim.mer (object, n.sims = 100)

```

**Arguments**

|        |   |
|--------|---|
| object | the output of a call to "lm" with n data points and k predictors. |
| ...    | further arguments passed to or from other methods.                |
| n.sims | number of independent simulation draws to create.                 |

**Value**

|           |  |
|-----------|--|
| sigma.sim | vector of n.sims random draws of sigma (for glm's, this just returns a vector of 1's or else of the square root of the overdispersion parameter if that is in the model) |
| beta.sim  | matrix (dimensions n.sims x k) of n.sims random draws of beta  |

**Author(s)**

Andrew Gelman <gelman@stat.columbia.edu>; Yu-Sung Su <ys463@columbia.edu>; M.Grazia Pit-tau <grazia@stat.columbia.edu>

**Examples**

```

#Examples of "sim"
set.seed (1)
J <- 15
n <- J*(J+1)/2
group <- rep (1:J, 1:J)
mu.a <- 5
sigma.a <- 2
a <- rnorm (J, mu.a, sigma.a)
b <- -3
x <- rnorm (n, 2, 1)
sigma.y <- 6
y <- rnorm (n, a[group] + b*x, sigma.y)
u <- runif (J, 0, 3)
y123.dat <- as.data.frame (round (cbind (y, x, group), 2))

# Linear regression
x1 <- y123.dat$y
y1 <- y123.dat$x
M1 <- lm (y1 ~ x1)
display(M1)
M1.sim <- sim(M1)

# Logistic regression
u.data <- cbind (1:J, u)
dimnames(u.data)[[2]] <- c("group", "u")
u.dat <- as.data.frame (round (u.data, 2))
y <- rbinom (n, 1, invlogit (a[group] + b*x))
M2 <- glm (y ~ x, family=binomial(link="logit"))
display(M2)
M2.sim <- sim (M2)

# Using lmer:
# Example 1
E1 <- lmer (y ~ x + (1 | group))
display(E1)
E1.sim <- sim (E1)

# Example 2
u.full <- u[group]
E2 <- lmer (y ~ x + u.full + (1 | group))
display(E2)
E2.sim <- sim (E2)

# Example 3
y <- rbinom (n, 1, invlogit (a[group] + b*x))
E3 <- lmer (y ~ x + (1 | group), family=binomial(link="logit"),
  control=list(usePQL=TRUE))
display(E3)
E3.sim <- sim (E3)

```

## Description

Numeric variables that take on more than two values are each rescaled to have a mean of 0 and a sd of 0.5; Binary variables are rescaled to have a mean of 0 and a difference of 1 between their two categories; Non-numeric variables that take on more than two values are unchanged; Variables that take on only one value are unchanged

## Usage

```
standardize(object, unchanged = NULL,
            standardize.y = FALSE, binary.inputs = "center")
```

## Arguments

|                            |   |
|----------------------------|---|
| <code>object</code>        | an object of class "lm" or "glm"                      |
| <code>unchanged</code>     | vector of names of parameters to leave unstandardized |
| <code>standardize.y</code> | if TRUE, the outcome variable is standardized also    |
| <code>binary.inputs</code> | options for standardizing binary variables            |

## Details

"0/1" (rescale so that the lower value is 0 and the upper is 1) "-0.5/0.5" (rescale so that the lower value is -0.5 and upper is 0.5) "center" (rescale so that the mean of the data is 0 and the difference between the two categories is 1) "full" (rescale by subtracting the mean and dividing by 2 sd's) "leave.alone" (do nothing)

## Examples

```
# Set up the fake data
n <- 100
x <- rnorm(n, 2, 1)
x1 <- rnorm(n)
x1 <- (x1 - mean(x1)) / (2 * sd(x1)) # standardization
x2 <- rbinom(n, 1, .5)
b0 <- 1
b1 <- 1.5
b2 <- 2
y <- rbinom(n, 1, invlogit(b0 + b1 * x1 + b2 * x2))
M1 <- glm(y ~ x, family = binomial(link = "logit"))
display(M1)
```

```
M2 <-standardize (M1)
display (M2)
```

triangleplot

*Triangle Plot*

## Description

Function for making a triangle plot from a square matrix

## Usage

```
triangleplot (x, y=NULL, cutpts=NULL, details=TRUE,
              n.col.legend=5, cex.col=0.7,
              cex.var=0.9, digits=1, color=FALSE)
```

## Arguments

|                           |   |
|---------------------------|---|
| <code>x</code>            | a square matrix.  |
| <code>y</code>            | a vector of names that corresponds to each element of the square matrix <code>x</code> .  |
| <code>cutpts</code>       | a vector of cutting points for color legend, default is <code>NULL</code> . The function will decide the cutting points if <code>cutpts</code> is not assigned. |
| <code>details</code>      | show more than one digits correlaton values. Default is <code>TRUE</code> . <code>FALSE</code> is suggested to get readable output.                             |
| <code>n.col.legend</code> | number of legend for the color thermometer  |
| <code>cex.col</code>      | font size of the color thermometer.   |
| <code>cex.var</code>      | font size of the variable names.  |
| <code>digits</code>       | number of digits shown in the text of the color theromoeter.  |
| <code>color</code>        | color of the plot, default is <code>FALSE</code> , which uses gray scale.   |

## Details

The function makes a triangle plot from a square matrix, e.g., the correlation plot, see [corrplot](#). If a square matrix contains missing values, the cells of missing values will be marked “x”.
