

# Package ‘RcmdrPlugin.RiskDemo’

November 13, 2023

**Type** Package

**Title** R Commander Plug-in for Risk Demonstration

**Version** 3.1

**Date** 2023-11-13

**Author** Arto Luoma

**Maintainer** Arto Luoma <arto.luoma@wippies.com>

**Description**

R Commander plug-in to demonstrate various actuarial and financial risks. It includes valuation of bonds and stocks, portfolio optimization, classical ruin theory, demography and epidemic.

**Depends** R (>= 3.5.0)

**Imports** stats, Rcmdr, demography, forecast, ftsa, ggplot2, dplyr, scales, zoo, data.table

**Suggests** tkrplot, rgl

**License** GPL-2

**LazyData** no

**LazyLoad** yes

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2023-11-13 14:23:20 UTC

RcmdrPlugin.RiskDemo-package

*R Commander Plug-in for Risk Demonstration*

---

## Description

R Commander plug-in to demonstrate various actuarial and financial risks. It includes valuation of bonds and stocks, portfolio optimization, classical ruin theory, demography and epidemic.

## Details

Package:	RcmdrPlugin.RiskDemo
Type:	Package
Version:	3.0
Date:	2021-04-03
License:	GPL (>= 2)
LazyLoad:	yes

`bondCurve`*Drawing forward and yield curves*

---

**Description**

This function draws forward and yields curves, for AAA-rated central government bonds and/or all central government bonds.

**Usage**

```
bondCurve(date1, date2 = NULL, yield = TRUE, forward = TRUE,  
          AAA = TRUE, all = TRUE, params)
```

**Arguments**

<code>date1</code>	The date for which the curves are drawn
<code>date2</code>	Optional second date for which the curves are drawn
<code>yield</code>	Is the yield curve shown (TRUE/FALSE)?
<code>forward</code>	Is the forward curve shown (TRUE/FALSE)?
<code>AAA</code>	Are the curves drawn for the AAA-rated bonds (TRUE/FALSE)?
<code>all</code>	Are the curves drawn for the bonds with all ratings (TRUE/FALSE)?
<code>params</code>	The data frame of curve parameters

**Value**

No value. Only a figure is produced.

**Author(s)**

Arto Luoma

**References**

<https://bit.ly/2zfs0G8>

**Examples**

```
data(params)  
bondCurve(as.Date("2004-09-06"), params=params)
```

---

bondFigure	<i>Bond price as a function of interest rate.</i>
------------	---

---

### Description

This function plots the bond price as a function of interest rate. It also shows, using dotted lines, the yield to maturity rate corresponding to the face value, and the flat price corresponding to the yield to maturity.

### Usage

```
bondFigure(buyDate, matDate, rateCoupon, yieldToMat = NULL,  
           bondPr = NULL, nPay)
```

### Arguments

buyDate	the date when the coupon is bought (settlement date)
matDate	maturity date
rateCoupon	coupon rate (in decimals)
yieldToMat	yield to maturity (in decimals)
bondPr	the flat price of the bond
nPay	number of coupon payments per year

### Details

either yieldToMat or bondPr should be given as input.

### Value

This function only plots a figure.

### Author(s)

Arto Luoma <arto.luoma@wippies.com>

### References

Bodie, Kane, and Marcus (2014) *Investments, 10th Global Edition*, McGraw-Hill Education, (see Section 14.2 Bond Pricing).

### See Also

[bondPrice](#), [solveYield](#)

**Examples**

```

bondFigure("2012-7-31","2018-7-31",rateCoupon=0.0225,yieldToMat=0.0079,
           nPay=2)
bondFigure("2012-7-31","2018-7-31",rateCoupon=0.0225,bondPr=90,nPay=2)

```

---

bondPrice	<i>Computing bond prices</i>
-----------	------------------------------

---

**Description**

This function computes the bond price, given the yield to maturity.

**Usage**

```
bondPrice(buyDate, matDate, rateCoupon, yieldToMat, nPay)
```

**Arguments**

buyDate	the date at which the bond is bought (settlement date).
matDate	maturity date
rateCoupon	annual coupon rate
yieldToMat	yield to maturity
nPay	number of coupon payments per year

**Details**

All the rates are given in decimals.

**Value**

A list with the following components:

yieldToMaturity	yield to maturity
flatPrice	flat price
daysSinceLastCoupon	days since previous coupon payment
daysInCouponPeriod	days in a coupon period
accruedInterest	accrued interest since last coupon payment
invoicePrice	invoice price (= flat price + accrued interest)

**Note**

With Excel functions PRICE, DATE, COUPDAYBS and COUPDAYS you can do the same.

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

**Examples**

```
bondPrice("2012-7-31", "2018-7-31", 0.0225, 0.0079, 2)
bondPrice("2012-7-31", "2018-7-31", 0.0225, 0.0079, 4)
bondPrice("2012-7-31", "2030-5-15", 0.0625, 0.02117, 2)
```

---

computeRuin

*Ruin probability computation with infinite time horizon*

---

**Description**

This function uses classical ruin theory to compute either ruin probability, safety loading or initial capital, given two of them. The time horizon is infinite. Gamma distribution is used to model claim sizes.

**Usage**

```
computeRuin(U0 = NULL, theta = NULL, eps = NULL, alpha, beta)
```

**Arguments**

U0	initial capital
theta	safety loading
eps	ruin probability
alpha	shape parameter of gamma distribution
beta	rate parameter of gamma distribution

**Value**

The value is a list with the following components:

LundbergExp	Lundberg's exponent R
initialCapital	initial capital
safetyLoading	safety loading
ruinProb	ruin probability

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

Gray and Pitts (2012) *Risk Modelling in General Insurance: From Principles to Practice*, Cambridge University Press.

**See Also**

[computeRuinFinite](#), [solveLund](#)

**Examples**

```
computeRuin(U0=1000, theta=0.01, alpha=1, beta=0.1)
computeRuin(eps=0.005, theta=0.01, alpha=1, beta=0.1)
computeRuin(U0=5399.24, eps=0.005, alpha=1, beta=0.1)
```

---

computeRuinFinite      *Ruin probability computation with finite time horizon*

---

**Description**

This function uses classical ruin theory to compute either ruin probability, safety loading or initial capital, given two of them. The time horizon is finite. Gamma distribution is used to model claim sizes.

**Usage**

```
computeRuinFinite(T0, U0 = NULL, theta = NULL, eps = NULL, lambda,
                  alpha, beta)
```

**Arguments**

T0	time horizon (in years)
U0	initial capital
theta	safety loading
eps	ruin probability
lambda	claim intensity (mean number of claims per year)
alpha	shape parameter of gamma distribution
beta	rate parameter of gamma distribution

**Value**

The value is a list with the following components:

LundbergExp	Lundberg's exponent R
initialCapital	initial capital
safetyLoading	safety loading
ruinProb	ruin probability

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**See Also**

[computeRuin](#), [solveLund](#)

**Examples**

```
computeRuinFinite(T0=100,U0=1000,theta=0.01,lambda=100,alpha=1,beta=0.1)
computeRuinFinite(T0=1,eps=0.005,theta=0.001,lambda=100,alpha=1,beta=0.1)
computeRuinFinite(T0=500,U0=5347,eps=0.005,lambda=100,alpha=1,beta=0.1)
```

---

countries.mort

*Mortality data*

---

**Description**

Mortality data for 10 countries (period death rates and exposures) retrieved from Human Mortality Database. The data are rounded to three significant digits and include the Nordic countries, China, U.S., Russia, Japan and Germany.

**Usage**

```
data("countries.mort")
```

**Format**

List of objects of class demogdata.

**Source**

HMD. Human Mortality Database. Max Planck Institute for Demographic Research (Germany), University of California, Berkeley (USA), and French Institute for Demographic Studies (France). Available at [www.mortality.org](http://www.mortality.org). (Data downloaded Nov 13, 2023.)

**Examples**

```
data(countries.mort)
plot(countries.mort[[1]])
```

---

covidSmooth	<i>Kalman smoothing of the covid model</i>
-------------	--

---

### Description

This function does Kalman smoothing for the simple model that is used to predict new COVID-19 cases.

### Usage

```
covidSmooth(par, y)
```

### Arguments

par	Logarithms of the variance parameters of drift, seasonal component, and error term
y	Univariate numeric time series of new COVID-19 cases

### Details

See `loglikCovid`.

### Value

Xif	Matrix of filtered values, where the state vectors are given as rows
Xis	Matrix of smoothed values, where the state vectors are given as rows
Pmat	Array of state uncertainty matrices, evaluated at time $t-1$ . The first array index is for time.
Pfmat	Array of state uncertainty matrices, evaluated at time $t$ . The first array index is for time.
Psmat	Array of state uncertainty matrices, evaluated at time $n$ , where $n$ is the number of observations. The first array index is for time.

### Author(s)

Arto Luoma

## Examples

```
#Preparing a time series
library(zoo)
data(dataCovidFin)
timeindex <- dataCovidFin[dataCovidFin$Alue=="Kaikki Alueet", "Aika"]
series <- dataCovidFin[dataCovidFin$Alue=="Kaikki Alueet", "val"]
series <- window(zoo(series, order.by=timeindex), start="2020-03-01",
                 end="2021-03-01")

#Fitting a state space model and smoothing the components
p0 <- c(-9, -7, -3.3)
fit <- nlm(loglikCovid, p=p0, y=series)
out <- covidSmooth(fit$estimate, y=series)

#Plotting the filtered and smoothed components
smoothed <- zoo(out$Xis[, 1:3], order.by=time(series))
filtered <- zoo(out$Xif[, 1:3], order.by=time(series))
colnames(smoothed) <- colnames(filtered) <- c("Level", "Drift", "Seasonal")
plot(filtered, xlab="Time", main="Filtered components of the time series")
plot(smoothed, xlab="Time", main="Smoothed components of the time series")

#Plotting the original time series, and the filtered and smoothed local level
#series after transforming them to original scale
plot(series, xlab="Time", ylab="Time series")
lines(exp(filtered[, 1])-2, col=3)
lines(exp(smoothed[, 1])-2, col=2)
legend("topleft", c("original", "filtered", "smoothed"), col=c(1, 3, 2), lty=1)
```

---

dataCovid

*COVID-19 statistics*

---

## Description

This data set consists of several statistics about the COVID-19 pandemic in 45 countries.

## Usage

```
data("dataCovid")
```

## Format

A data frame with 18400 observations on the following 27 variables.

location a character vector

date a Date

new\_cases a numeric vector

new\_cases\_per\_million a numeric vector

new\_cases\_smoothed\_per\_million a numeric vector

new\_cases\_smoothed a numeric vector

`new_deaths_per_million` a numeric vector  
`new_deaths` a numeric vector  
`new_deaths_smoothed_per_million` a numeric vector  
`new_deaths_smoothed` a numeric vector  
`total_deaths_per_million` a numeric vector  
`total_deaths` a numeric vector  
`total_cases` a numeric vector  
`total_cases_per_million` a numeric vector  
`hosp_patients` a numeric vector  
`hosp_patients_per_million` a numeric vector  
`icu_patients_per_million` a numeric vector  
`icu_patients` a numeric vector  
`reproduction_rate` a numeric vector  
`new_tests` a numeric vector  
`new_tests_per_thousand` a numeric vector  
`tests_per_case` a numeric vector  
`positive_rate` a numeric vector  
`new_tests_smoothed` a numeric vector  
`new_tests_smoothed_per_thousand` a numeric vector  
`total_tests` a numeric vector  
`total_tests_per_thousand` a numeric vector

### **Details**

This is a subset of the complete data set available online, downloaded on March 31, 2021.

### **Source**

<https://covid.ourworldindata.org/data/owid-covid-data.csv>

### **Examples**

```
library(zoo)
data(dataCovid)
casesFin <- subset(dataCovid,subset=location=="Finland", select=c(date,new_cases))
plot(zoo(casesFin$new_cases,order.by=casesFin$date),ylab="New COVID-19 cases in Finland",
xlab="")
```

---

dataCovidFin	<i>Confirmed COVID-19 cases in Finland</i>
--------------	--

---

### Description

This data set provides the confirmed COVID-19 cases in 21 Finnish hospital districts, in addition to the total number.

### Usage

```
data("dataCovidFin")
```

### Format

A data frame with 16082 observations on the following 3 variables.

Aika Date

Alue character vector: hospital district

val numeric vector: number of new confirmed cases

### Details

The data were downloaded on March 31, 2021, via THL's open data API.

### Source

<https://bit.ly/2PO1DnS>

### References

<https://bit.ly/3ryfwE4>

### Examples

```
library(zoo)
data(dataCovidFin)
casesFin <- subset(dataCovidFin, subset = Alue=="Kaikki Alueet")
plot(zoo(casesFin$val, order.by=casesFin$Aika), ylab="New COVID-19 cases in Finland", xlab="")
```

---

drawBars *Plotting epidemic statistics*

---

### Description

This function plots several epidemic statistics for selected countries.

### Usage

```
drawBars(data, countries, start = "2020-06-01", end = "last", measure = "new_cases",
         atop = TRUE, perMillion = FALSE, drawMean = TRUE, bars = TRUE)
```

### Arguments

data	data frame similar to (or including the same columns as) dataCovid
countries	vector of characters strings indicating the countries for which the selected statistic is plotted
start	beginning date of the time window for which the statistic is plotted
end	ending date of the time window for which the statistic is plotted
measure	statistic to be plotted
atop	logical indicating if the bars of different countries are plotted on top of one another
perMillion	logical indicating if the statistic is proportioned to a population of million
drawMean	logical indicating if a smoothed curve is drawn
bars	logical indicating if bars are plotted

### Value

No value.

### Author(s)

Arto Luoma <arto.luoma@wippies.com>

### See Also

[drawBarsFin](#), [dataCovid](#)

### Examples

```
data(dataCovid)
drawBars(data=dataCovid, countries=c('Finland','France'),start='2020-6-1',
         measure='new_cases',perMillion=TRUE)
```

---

drawBarsFin

*Plotting epidemic statistics with Finnish data*

---

### Description

This function plots the new cases or total cases of an epidemic for selected regions in Finland.

### Usage

```
drawBarsFin(data, pop, regions, start = "2020-06-01", end = "last",
            measure = "new_cases", atop = TRUE, perMillion = FALSE, drawMean = TRUE,
            bars = TRUE)
```

### Arguments

data	data frame including columns Aika (character string indicating the date), Alue (character string indicating the region) and val (numeric indicating the number of new cases)
pop	data frame including columns Alue (character string indicating the region) and val (integer indicating the population)
regions	vector of characters strings indicating the regions for which the selected statistic is plotted
start	beginning date of the time window for which the curve is plotted
end	ending date of the time window for which the curve is plotted
measure	statistic to be plotted
atop	logical indicating if the bars of different regions are plotted on top of one another
perMillion	logical indicating if the statistic is proportioned to a population of million
drawMean	logical indicating if a smoothed curve (rolling mean of 7 observations) is plotted
bars	logical indicating if bars are plotted

### Value

No value.

### Author(s)

Arto Luoma <arto.luoma@wippies.com>

### See Also

[drawBars](#), [dataCovidFin](#)

### Examples

```
data(dataCovidFin)
data(popRegionsFin)
drawBarsFin(dataCovidFin, popRegionsFin, regions=popRegionsFin$Alue[1:7])
```

---

drawFigure

*Efficient frontier and return distribution figures*

---

**Description**

Plots the efficient frontiers of risky investments and all investments. The optimum points corresponding to the risk aversion coefficient are indicated by dots. Further, the function plots a predictive return distribution figure.

**Usage**

```
drawFigure(symbol, yield, vol, beta, r = 1,
            total = 1, indexVol = 20, nStocks = 7, balanceInt = 12, A = 10,
            riskfree = FALSE, bor = FALSE)
```

**Arguments**

symbol	character vector of the symbols of the risky investments
yield	vector of yields (%)
vol	vector of volatilities (%)
beta	vector of betas (%)
r	risk-free interest rate (%)
total	total investment (for example in euros)
indexVol	volatility of market portfolio (%)
nStocks	number of risky investments in the portfolio
balanceInt	balancing interval of the portfolio in months
A	risk aversion coefficient (see details)
riskfree	is risk-free investment included in the portfolio (logical)
bor	is borrowing (negative risk-free investment) allowed (logical)

**Details**

The function uses the single-index model and Markovitz portfolio optimization model to find the optimum risky portfolio. The returns are assumed to be log-normally distributed. The maximized function is  $\mu - 0.5 \cdot A \cdot \text{var}$  where  $\mu$  is expected return,  $A$  is risk aversion coefficient, and  $\text{var}$  is return variance.

**Value**

portfolio	allocation of the total investment (in euros)
returnExpectation	expected portfolio return
returnDeviation	standard deviation of the portfolio

**Author(s)**

Arto Luoma <arto.luoma@wippiies.com>

**References**

Bodie, Kane, and Marcus (2014) *Investments, 10th Global Edition*, McGraw-Hill Education, (see Section 7.4 The Markowitz Portfolio Optimization Model and Section 8.2 The Single-Index Model).

**See Also**

[portfOptim](#)

**Examples**

```
data(stockData, package="RcmdrPlugin.RiskDemo")
with(stockData, drawFigure(symbol=rownames(stockData), yield=divYield,
  vol=vol, beta=beta, r=1, total=100, indexVol=10,
  nStocks=5, balanceInt=12, A=10, riskfree=TRUE, bor=FALSE))
```

---

drawIncidence

*Plotting incidence curves of an epidemic*

---

**Description**

This function plots incidence curves of an epidemic for selected countries. The incidences are new cases per 100 000 inhabitants within one or two weeks.

**Usage**

```
drawIncidence(data, countries, start = "2020-06-01", end = "last", weeks = 2,
  log = TRUE)
```

**Arguments**

data	data frame including columns location (character string indicating the country), date (character string) and new_cases_per_million (numeric)
countries	vector of characters strings indicating the countries for which the curves are plotted
start	beginning date of the time window for which the curve is plotted
end	ending date of the time window for which the curve is plotted
weeks	Integer telling how many weeks' observations are used to calculate the incidence. Usually 1 or 2.
log	logical indicating if a log scale is used in the plot

**Value**

No value

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**See Also**

[drawIncidenceFin](#), [dataCovid](#)

**Examples**

```
data(dataCovid)
Europe <- c("Germany", "France", "United Kingdom", "Italy", "Spain", "Poland", "Romania",
           "Netherlands", "Belgium", "Greece")
drawIncidence(dataCovid, countries=Europe)
```

---

drawIncidenceFin      *Plotting incidence curves of an epidemic with Finnish data*

---

**Description**

This function plots incidence curves of an epidemic for selected regions of Finland. The incidences are new cases per 100 000 inhabitants within one or two weeks.

**Usage**

```
drawIncidenceFin(data, pop, regions, start = "2020-06-01", end = "last", weeks = 2,
                 includeAllRegions = TRUE, log = TRUE)
```

**Arguments**

data	data frame including columns Aika (character string indicating the date), Alue (character string indicating the region) and val (numeric indicating the number of new cases)
pop	data frame including columns Alue (character string indicating the region) and val (integer indicating the population)
regions	vector of characters strings indicating the regions for which the curves are plotted
start	beginning date of the time window for which the curve is plotted
end	ending date of the time window for which the curve is plotted
weeks	Integer telling how many weeks' observations are used to calculate the incidence. Usually 1 or 2.
includeAllRegions	logical indicating if a curve for total incidence is included
log	logical indicating if a log scale is used in the plot

**Value**

No value

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**See Also**

[drawIncidence](#), [dataCovidFin](#)

**Examples**

```
data(dataCovidFin)
data(popRegionsFin)
drawIncidenceFin(data = dataCovidFin, pop = popRegionsFin,
  regions = popRegionsFin$Alue[1:5], start = "2020-06-01", end="last", weeks=2,
  includeAllRegions = TRUE)
```

---

drawPositiveRate

*Plotting the positive rate of COVID-19 tests or the tests per case*

---

**Description**

This function plots a time series of either the positive rate of COVID-19 tests or the number of tests per case.

**Usage**

```
drawPositiveRate(data, countries, start = "2020-06-01", end = "last",
  measure = "positive_rate", curve = TRUE, bars = FALSE, log = FALSE)
```

**Arguments**

data	data frame including columns location (character string indicating the country), date (character string) and tests_per_case, positive_rate (numeric)
countries	vector of characters strings indicating the countries for which the selected statistic is plotted
start	beginning date of the time window for which the time series are plotted
end	ending date of the time window for which the time series are plotted
measure	statistic for which the time series are plotted
curve	logical indicating if smoothed curves are drawn
bars	logical indicating if bars are plotted
log	logical indicating if a log scale is used in the plot

**Value**

No value.

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**See Also**

[dataCovid](#), [drawTests](#)

**Examples**

```
data(dataCovid)
drawPositiveRate(dataCovid,countries=c("Finland", "France"))
```

---

drawRuin

*Plotting simulations of a surplus process*

---

**Description**

This function plots simulation paths of a surplus process. The claims are assumed to arrive according to a Poisson process and the claim sizes are assumed to be gamma distributed.

**Usage**

```
drawRuin(nsim = 10, Tup = 10, U0 = 1000, theta = 0.01,
         lambda = 100, alpha = 1, beta = 0.1)
```

**Arguments**

nsim	number of simulations
Tup	maximum value in the time axis
U0	initial capital
theta	risk loading
lambda	intensity of claim process (mean number of claims per year)
alpha	shape parameter of gamma distribution
beta	rate parameter of gamma distribution

**Value**

No value; only a figure is plotted.

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

drawRuin(nsim=10,Tup=10,U0=1000,theta=0.0125,lambda=100,alpha=1,beta=0.1)
```

---

drawTests

*Plotting time series related to COVID-19 testing*

---

**Description**

This function plots time series of new and total COVID-19 tests, possibly in proportion to population.

**Usage**

```
drawTests(data, countries, start = "2020-06-01", end = "last", measure = "new_tests",
          atop = TRUE, perThousand = FALSE, drawMean = TRUE, bars = TRUE, log = FALSE)
```

**Arguments**

data	data frame similar to (or including the same columns as) dataCovid
countries	vector of characters strings indicating the countries for which the time series are plotted
start	beginning date of the time window for which the time series are plotted
end	ending date of the time window for which the time series are plotted
measure	statistic for which the time series are plotted
atop	logical indicating if the bars of different countries are plotted on top of one another
perThousand	logical indicating if the statistic is proportioned to a population of thousand
drawMean	logical indicating if a smoothed curve is drawn
bars	logical indicating if bars are plotted
log	logical indicating if a log scale is used in the plot

**Value**

No value.

fin	<i>Mortality data for Finland</i>
-----	-----------------------------------

---

**Description**

Mortality data for Finland Series: female male total Years: 1878 - 2015 Ages: 0 - 110

**Usage**

```
data("fin")
```

**Format**

object of class demogdata

**Details**

This is part of the countries.mort data (countries.mort[[11]]).

**Source**

HMD. Human Mortality Database. Max Planck Institute for Demographic Research (Germany), University of California, Berkeley (USA), and French Institute for Demographic Studies (France). Available at [www.mortality.org](http://www.mortality.org). (Data downloaded Nov 13, 2023.)

**Examples**

```
data(fin)
print(fin)
plot(fin)
```

---

fin.fcast	<i>Finnish mortality forecast</i>
-----------	-----------------------------------

---

**Description**

Finnish mortality forecast 50 years ahead (2023-2072) for 0 - 100 years old. The forecast is based on an estimated Lee-Carter model. The kt coefficients were forecast using a random walk with drift. Fitted rates were used as the starting value.

**Usage**

```
data("fin.fcast")
```

**Format**

An object of class "fmforecast"; for details, see documentation of package "demography".

**Details**

The forecast was produced using function "forecast.lca" of package "demography".

**Examples**

```
data(fin.fcast)
print(fin.fcast)
plot(fin.fcast)
```

---

fin.lca	<i>Lee-Carter model fit for Finnish data</i>
---------	--

---

**Description**

Lee-Carter model fit obtained by function "lca" of package "demography". The fit is based on Finnish mortality data for ages from 0 to 100 and years from 1950 to 2022.

**Usage**

```
data("fin.lca")
```

**Format**

object of class "lca"

**Details**

Both sexes were included in the input mortality data.

**Examples**

```
data(fin.lca)
plot(fin.lca)
```

---

loglikCovid

*Computing the log-likelihood of the covid model*

---

**Description**

This function computes -2 times the log-likelihood of the simple model that is used to predict new COVID-19 cases and to estimate the effective reproduction number.

**Usage**

```
loglikCovid(y, par, it = TRUE)
```

**Arguments**

y	Univariate numeric time series of new COVID-19 cases
par	Logarithms of the variance parameters of drift, seasonal component, and error term
it	A logical value indicating if only the log-likelihood is returned.

**Details**

Some multiplicative and additive constants are omitted when the negative log-likelihood is computed. Before computing the log-likelihood, the transformation  $y = \log(x+a)$ , where  $a=2$ , is applied to the time series. The model is a simple local linear model with local level, drift and seasonal component. The variance parameters of the level and seasonal component are estimated while the variance of the level component is computed as  $\max(\exp(xi[1]) - a, 0.1)/\exp(xi[1])^2$ , where  $xi[1]$  is the current estimate of the level. This is based on the assumption that the number of new cases is approximately Poisson distributed, so that the variance equals the level. The *max* operation is taken in order to prevent the expression from being negative. In order to facilitate estimation, a penalty term is added which corresponds to a prior of  $N(-9, 1)$  for the logarithm of the drift variance.

**Value**

loglik	-2 times the penalized log likelihood apart from some additive constants
ll	Vector of the increments of the log-likelihood corresponding to individual observations
Xi	Matrix of one-step predictions of the state vector. The vectors at different time points are given as rows.
Xif	Matrix of filtered values, where the state vectors are given as rows
Pfmat	Array of state uncertainty matrices, evaluated at time $t$ . The first array index is for time.
Q	Covariance matrix of the error vector of the state equation

params

*Yield curve parameter data*

---

**Description**

Yield curve parameters from the European Central Bank (ECB), downloaded on Nov 4, 2023

**Usage**

```
data("params")
```

**Format**

A data frame with 4902 observations on the following 13 variables.

date a Date

b0 a numeric vector

b1 a numeric vector

b2 a numeric vector

b3 a numeric vector

t1 a numeric vector

t2 a numeric vector

c0 a numeric vector

c1 a numeric vector

c2 a numeric vector

c3 a numeric vector

d1 a numeric vector

d2 a numeric vector

## Details

The parameters b0 to b3 are the beta-parameters, and t1 and t2 the tau-parameters for AAA-rated government bonds. The parameters c0 to c3 are the beta-parameters, and d1 and d2 the tau-parameters for all government bonds.

## Source

<https://bit.ly/2zfs0G8>

## Examples

```
data(params)
bondCurve(as.Date("2004-09-06"), params=params)
```

---

plotForecast	<i>Forecasting new covid cases</i>
--------------	------------------------------------

---

## Description

This function forecasts the numbers of new covid cases using a simple linear state space model.

## Usage

```
plotForecast(data, region, start = NULL, end = NULL, np = 30, predInt = 0.95,
             log = TRUE)
```

## Arguments

data	data frame including columns Aika (character string indicating the date), Alue (character string indicating the region) and val (numeric indicating the number of new cases)
region	characters string indicating the region for which the forecast is made
start	beginning date of the observations used in the estimation of the forecasting model
end	ending date of the observations used in the estimation of the forecasting model
np	integer indicating the forecasting horizon in days
predInt	decimal indicating the probability of the forecasting interval
log	logical indicating if a log scale is used in the plot

## Value

No value.

data(dataCovidFin)
plotForecast(data=dataCovidFin, region='All regions', start="2020-09-01")
```

---

plotR

*Plotting the effective reproduction number (R)*

---

**Description**

This function plots a time series of the effective reproduction number R and its confidence interval.

**Usage**

```
plotR(data, region, start = NULL, end = NULL, confInt = 0.95)
```

**Arguments**

data	data frame including columns Aika (character string indicating the date), Aalue (character string indicating the region) and val (numeric indicating the number of new cases)
region	characters string indicating the region for which the R series is computed
start	beginning date of the time window for which the R is computed
end	ending date of the time window for which the R is computed
confInt	decimal between 0 and 1, indicating the level of the confidence interval of R

**Value**

No value

---

pop.pred	<i>Population forecasting</i>
----------	-------------------------------

---

## Description

Population forecasting using mortality forecast and simple time series forecast for age 0 population

## Usage

```
pop.pred(mort, mort.fcast)
```

## Arguments

mort	mortality data of class 'demogdata'
mort.fcast	mortality forecast of class 'fmforecast'

## Details

ARIMA(0,2,2)-model is used to forecast age 0 populaton.

## Value

population forecast of class 'demogdata'

## Author(s)

Arto Luoma <arto.luoma@wippies.com>

## Examples

```
data(fin)
data(fin.fcast)
fin.pcast <- pop.pred(fin, fin.fcast)
plot(fin, plot.type="functions", series="total", transform=FALSE,
      datatype="pop", ages=c(0:100), years=c(1990+0:5*10), xlab="Age")
lines(fin.pcast, plot.type="functions", series="total", transform=FALSE,
      datatype="pop", ages=c(0:100), years=c(1990+0:5*10), lty=2)
```

---

popRegionsFin

*Population data on Finnish hospital districts*

---

### **Description**

This data set provides the populations of the 21 hospital districts, in addition to the total Finnish population.

### **Usage**

```
data("popRegionsFin")
```

### **Format**

A data frame with 22 observations on the following 2 variables.

Alue character vector: hospital district

val numeric vector: population

### **Details**

The data were downloaded on March 31, 2021, via THL's open data API.

### **Source**

<https://bit.ly/39uZy7C>

### **References**

<https://bit.ly/3ryfwE4>

### **Examples**

```
data(popRegionsFin)  
print(popRegionsFin)
```

---

portfOptim	<i>Portfolio optimization for an index model</i>
------------	--

---

### Description

Finds an optimal portfolio for long-term investments and plots a return distribution.

### Usage

```
portfOptim(i, symbol, yield, vol, beta,
  indexVol = 0.2, nStocks = 7, total = 1, balanceInt = 1,
  C = 0.05, riskProportion = 1, riskfreeRate = 0, sim = FALSE)
```

### Arguments

i	vector of the indices of the included risky investments
symbol	character vector of the symbols of the risky investments
yield	vector of expected yields (in euros)
vol	vector of volatilities
beta	vector of betas
indexVol	portfolio index volatility
nStocks	number of stocks in the portfolio
total	total sum invested (in euros)
balanceInt	balancing interval of the portfolio (in years)
C	expected portfolio return (in euros)
riskProportion	proportion of risky investments
riskfreeRate	risk-free interest rate
sim	is the return distribution simulated and plotted (logical value)?

### Details

The arguments `vol`, `beta`, `indexVol`, `riskProportion` and `riskfreeRate` are given in decimals. The portfolio is optimized by minimizing the variance of the portfolio yield for a given expected yield. The returns are assumed to be log-normally distributed. The covariance matrix is computed using the single index model and the properties of the log-normal distribution.

### Value

portfolio	numeric vector of allocations to each stock (in euros)
returnExpectation	expected value of the return distribution (in euros)
returnDeviation	standard deviation of the return distribution (in euros)
VaR	0.5%, 1%, 5%, 10% and 50% percentiles of the return distribution (in euros)

**Note**

This function is usually called by drawFigure.

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

**See Also**

[drawFigure](#)

**Examples**

```
data(stockData, package="RcmdrPlugin.RiskDemo")
with(stockData, portfOptim(i=1:5, symbol=rownames(stockData),
  yield=divYield/100, vol=vol/100, beta=beta/100, total=100, sim=TRUE))
```

---

returns

*Computing expected returns and their covariance matrix*

---

**Description**

Computing expected returns and their covariance matrix when the returns are lognormal.

**Usage**

```
returns(volvec, indexvol, beta)
```

**Arguments**

volvec	vector of volatilities
indexvol	volatility of the portfolio index
beta	vector of betas

**Details**

The arguments are given in decimals. The single index model is used to compute the covariance matrix of a multivariate normal distribution. The mean vector is assumed to be zero. The properties of the log-normal distribution are then used to compute the mean vector and covariance matrix of the corresponding multivariate log-normal distribution.

**Value**

mean	vector of expected returns
cov	covariance matrix of returns

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

**Examples**

```
returns(volvec=c(0.1,0.2,0.3),indexvol=0.2, beta=c(0.5,-0.1,1.1))
```

---

solveLund	<i>Solving Lund's exponent</i>
-----------	--------------------------------

---

**Description**

This function solves Lund's exponent or adjustment coefficient. The claim sizes are assumed to be gamma distributed.

**Usage**

```
solveLund(alpha, beta, theta)
```

**Arguments**

alpha	shape parameter of gamma distribution
beta	rate parameter of gamma distribution
theta	safety loading

**Value**

Lundberg's exponent (or adjustment coefficient)

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

```

---

solveYield	<i>Computing bond yields</i>
------------	------------------------------

---

**Description**

This function computes the yield to maturity, given the (flat) bond price.

**Usage**

```
solveYield(buyDate, matDate, rateCoupon, bondPr, nPay)
```

**Arguments**

buyDate	settlement date (the date when the bond is bought)
matDate	maturity date
rateCoupon	annual coupon rate
bondPr	bond price. The flat price without accrued interest.
nPay	number of payments per year

**Details**

all the rates are given in decimals

**Value**

A list with the following components:

yieldToMaturity	yield to maturity
flatPrice	flat price
daysSinceLastCoupon	days since previous coupon payment
daysInCouponPeriod	days in a coupon period
accruedInterest	accrued interest since last coupon payment
invoicePrice	invoice price (= flat price + accrued interest)

**Note**

With Excel function YIELD you can do the same.

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

Bodie, Kane, and Marcus (2014) *Investments, 10th Global Edition*, McGraw-Hill Education, (see Bond Pricing between Coupon Dates in Section 14.2).

**See Also**

**Examples**

```
solveYield("2012-7-31", "2018-7-31", 0.0225, 100, 2)
```

---

stock.price

*Computing stock prices*

---

**Description**

This function computes the intrinsic stock price using the constant growth dividend discount model.

**Usage**

```
stock.price(dividend, k = NULL, g = NULL, ROE = NULL, b = NULL,
  riskFree = NULL, marketPremium = NULL, beta = NULL)
```

**Arguments**

dividend	expected dividend(s) for the next year(s) (in euros), separated by commas
k	required rate of return
g	growth rate of dividends
ROE	return on investment
b	plowback ratio
riskFree	riskfree rate
marketPremium	market risk premium
beta	beta

**Details**

All the above rates are given in percentages (except the dividends). One should provide either `k` or the following three: `riskFree`, `marketPremium`, `beta`. Further, one should provide either `g` or the following two: `ROE` and `b`. In the output, `k` and `g` are given in decimals.

**Value**

<code>dividend</code>	expected dividend(s) for the next year(s) (in euros)
<code>k</code>	required rate of return
<code>g</code>	growth rate of dividends
<code>PVGO</code>	present value of growths opportunities
<code>stockPrice</code>	intrinsic stock price

**Author(s)**

Arto Luoma <arto.luoma@wippies.com>

**References**

Bodie, Kane, and Marcus (2014) *Investments, 10th Global Edition*, McGraw-Hill Education, (see Dividend Discount Models in Section 18.3).

**Examples**

```
stock.price(dividend=c(1),k=12,g=10)
stock.price(dividend=c(1),ROE=50,b=20,riskFree=5,marketPremium=8,
            beta=90)
```

---

stockData

*Stock data*

---

**Description**

Stock data on large companies in Helsinki Stock Exchange, downloaded from Kauppalehti web page ([www.kauppalehti.fi](http://www.kauppalehti.fi)), on May 13, 2017

**Usage**

```
data("stockData")
```

**Format**

A data frame with 35 observations on the following 7 variables.

names name of the firm

abbrs abbreviation of the firm

quote closing quote

vol volatility (%)

beta beta (%)

div dividend (eur/stock)

divYield dividend yield (%)

**Source**

[www.kauppalehti.fi](http://www.kauppalehti.fi)

**Examples**

```
data(stockData)  
plot(stockData[,-(1:2)])
```
