Type Package

Title Real-Time PCR Data Sets by Rutledge et al. (2004)

Version 0.1.0

Description Real-time quantitative polymerase chain reaction (qPCR) data by Rutledge et al. (2004) <[doi:10.1093/nar/gnh177](https://doi.org/10.1093/nar/gnh177)> in tidy format. The data comprises a six-point, ten-fold dilution series, repeated in five independent runs, for two different amplicons. In each run, each standard concentration is replicated four times. Original raw data file:

Index**3**

rutledge*qPCR data set by Rutledge et al. (2004)*

Description

Each data set comprises a six-point, ten-fold dilution series, repeated in five independent runs, for two different amplicons: K1/K2, 102 bp, and K3/K2, 218 bp. Fluorescence readings were exported after background subtraction via baseline averaging of the 5 cycles immediately preceding the cycles in which fluorescence was first detected. Please read the Materials and Methods section of Rutledge et al. (2004) for more details.

Format

A **tibble** with 10,800 rows and 10 variables:

plate Plate identifier. Because one plate (run) was used per dilution series, **plate** values are simply numbered 1 thru 5.

well Well identifier. Values are always NA (not available). This variable is kept nevertheless to be coherent with other data sets from other similar R data packages.

dye The type of dye used. In this data set the values are always "SYBR", meaning SYBR Green I master mix (Roche).

target Target identifier: the amplicon used, K1/K2 or K3/K2.

sample_type Sample type (all curves are standards, i.e. "std").

replicate Replicate identifier: 1 thru 4.

copies Standard copy number.

dilution Dilution factor. Higher number means greater dilution.

cycle PCR cycle.

fluor Raw fluorescence values.
