# Package 'treenomial' 

October 14, 2022

## Type Package

Title Comparison of Trees using a Tree Defining Polynomial
Version 1.1.4
Maintainer Matthew Gould [mgould@sfu.ca](mailto:mgould@sfu.ca)
Description Provides functionality for creation and comparison of polynomials that uniquely describe trees as introduced in Liu (2019, [arXiv:1904.03332](arXiv:1904.03332)). The core method converts rooted unlabeled phylo objects from 'ape' to the tree defining polynomials described with coefficient matrices. Additionally, a conversion for rooted binary trees with binary trait labels is also provided. Once the polynomials of trees are calculated there are functions to calculate distances, distance matrices and plot different distance trees from a target tree. Manipulation and conversion to the tree defining polynomials is implemented in C++ with 'Rcpp' and 'RcppArmadillo'. Furthermore, parallel programming with 'RcppThread' is used to improve performance converting to polynomials and calculating distances.

Depends R (>= 3.5.0)
License GPL (>= 2)
URL https://github.com/gouldmatt/treenomial

## Encoding UTF-8

Imports Rcpp (>= 1.0.1), ape, methods
LinkingTo Rcpp, RcppArmadillo, RcppThread (>= 2.1.3)
RoxygenNote 7.2.0
Suggests knitr, rmarkdown, testthat
NeedsCompilation yes

alignPoly Align various types of coefficient matrices

## Description

Align various types of coefficient matrices

## Usage

alignPoly(coefficientMatrices)

## Arguments

## coefficientMatrices

a list of coefficient matrices of various sizes

## Details

Alignment depends on the type of coefficient matrix:
"real" the smaller matrices columns are prepended with zero columns to align with the max number of columns and the rows are appended with zero rows to match the max number of rows
"yEvaluated" the smaller vectors are appended with zeroes to match the max length vector
"tipLabel" the smaller matrices are appended with zeroes to match the max number of rows and columns

## Value

the aligned list of coefficient matrices

## Examples

```
library(treenomial)
library(ape)
differentSizeTrees <- c(rtree(2), rmtree(10,10))
coeffs <- treeToPoly(differentSizeTrees, numThreads = 0)
alignedCoeffs <- alignPoly(coeffs)
```

allTrees

## Description

Return normal coefficient matrices, substituted y coefficient vectors, or phylo objects for all possible unordered full m-ary trees up to n tips. For binary trees $(\mathrm{m}=2)$, the number of trees at each number of tips follows the Wedderburn-Etherington numbers.

## Usage

allTrees(n, m = 2, type = c("default", "yEvaluated", "phylo"), y)

## Arguments

n
m
type
y the y value to evaluate the polynomial at when type is "yEvaluated", ignored otherwise

## Value

list of lists containing all the trees in type format for each number of tips

## Note

only $\mathrm{m}=2$ is currently supported

## Examples

```
library(treenomial)
library(ape)
# generate coefficient matrices describing the polynomials of all possible
# unordered full binary trees up to 10 tips
allBinTenRealCoeff <- allTrees(10, type = "phylo")
# number of trees at each number of tips follows Wedderburn-Etherington numbers
lengths(allBinTenRealCoeff)
# phylo type example, plot all 6 tip unordered full binary trees
# backup par options
oldpar <- par(no.readonly =TRUE)
allBinSixPhylo <- allTrees(6, type = "phylo")[[6]]
par(mfrow=c(1,6))
plots <- lapply(allBinSixPhylo, function(t){
    plot.phylo(ladderize(t), direction = "downwards", show.tip.label = FALSE)
})
# restore par options
par(oldpar)
```

## Description

Plot the min/max distance trees from a target tree

```
Usage
    plotExtremeTrees(
        target,
        trees,
    n,
    comparison = "min",
    method = c("fraction", "logDiff", "wLogDiff", "pa", "ap"),
    type = c("default", "yEvaluated", "tipLabel"),
    y,
    numThreads = -1
)
```

## Arguments

$\left.\begin{array}{ll}\text { target } & \text { the phylo object of the tree to calculate the distances to } \\ \text { trees } & \text { a list of phylo objects to compare with the target } \\ \text { n } & \text { the number of trees to find and plot } \\ \text { comparison } & \text { whether to find the "min" or the "max" distance trees from the target } \\ \text { method } & \text { method to use when calculating coefficient distances: } \\ \text { "fraction" for two coefficient matrices A and B returns sum(abs(A-B)/(A+B)), } \\ \text { "logDiff" for two coefficient matrices A and B returns sum(log(1+abs(A-B)) } \\ \text { "wLogDiff" performs the "logDiff" method with weights on the rows }\end{array}\right]$ "pa"total pairs where the coefficient is present in one matrix and absent in the

## Value

a list of lists containing the $\mathbf{n} \mathrm{min} / \mathrm{max}$ distance trees and their distances to target

## Note

- the substituted y coefficient vector only supports the "logDiff" method and the "fraction" method
- "pa" and "ap" force symmetry in the output distance matrix

## Examples

```
library(treenomial)
library(ape)
trees <- c(rmtree(1000, 50), rmtree(10, 9))
target <- rtree(50)
minTrees <- plotExtremeTrees(target, trees, 2, comparison = "min", numThreads = 0)
```

```
polyDist Calculates the distance between coefficient matrices
```

## Description

Calculates the distance between two coefficient matrices or a coefficient matrix and a list of coefficient matrices.

## Usage

```
    polyDist(
        x,
        Y,
        method = c("fraction", "logDiff", "wLogDiff", "pa", "ap"),
        numThreads = -1
    )
```

## Arguments

$\mathrm{x} \quad$ single coefficient matrix to find distances to
$Y \quad a \operatorname{list}$ of coefficient matrices
method method to use when calculating coefficient distances:
"fraction" for two coefficient matrices A and B returns sum $(a b s(A-B) /(A+B))$, excluding elements where both A and B are zero
" $\log$ Diff" " for two coefficient matrices A and B returns $\operatorname{sum}(\log (1+a b s(A-B))$
"wLogDiff" performs the "logDiff" method with weights on the rows
"pa" total pairs where the coefficient is present in one matrix and absent in the other (presence-absence)
"ap" opposite comparison of pa (absence-presence)
numThreads number of threads to be used, the default ( -1 ) will use the number of cores in the machine and numThreads $=0$ will only use the main thread

## Value

vector of distances

## Note

- the substituted y coefficient vector only supports the "logDiff" method and the "fraction" method
- "pa" and "ap" force symmetry in the output distance matrix

## Examples

```
library(treenomial)
library(ape)
# distance between coefficient matrices of one 10 tip tree
# and 100 trees with 30 tips using
# create the coefficient matrices
tenTipTree <- rtree(10)
tenTipTreeCoeff <- treeToPoly(tenTipTree, numThreads = 0)
thirtyTipList <- rmtree(100, 30)
thirtyTipCoeffs <- treeToPoly(thirtyTipList, numThreads = 0)
# find the distance
polyDist(tenTipTreeCoeff, thirtyTipCoeffs, numThreads = 0)
```

polyToDistMat Calculates the distance matrix from a list coefficient matrices

## Description

Calculates the distance matrix from a list coefficient matrices

## Usage

```
polyToDistMat(
    coefficientMatrices,
    method = c("fraction", "logDiff", "wLogDiff", "pa", "ap"),
    numThreads = -1
)
```

## Arguments

coefficientMatrices
list of coefficient matrices
method method to use when calculating coefficient distances:
"fraction" for two coefficient matrices A and B returns sum(abs(A-B)/(A+B)), excluding elements where both A and B are zero
" $\log$ Diff" for two coefficient matrices A and B returns $\operatorname{sum}(\log (1+a b s(A-B))$
"wLogDiff" performs the "logDiff" method with weights on the rows
"pa" total pairs where the coefficient is present in one matrix and absent in the other (presence-absence)
"ap" opposite comparison of pa (absence-presence)
numThreads number of threads to be used, the default ( -1 ) will use the number of cores in the machine and numThreads $=0$ will only use the main thread

## Value

distance matrix calculated from argument coefficient matrices

## Note

- the substituted y coefficient vector only supports the "logDiff" method and the "fraction" method
- "pa" and "ap" force symmetry in the output distance matrix

## Examples

```
    library(treenomial)
    library(ape)
    # coefficient matrices for ten trees of 20 tips
    coeffs <- treeToPoly(rmtree(10, 20), numThreads = 0)
    # distance matrix from the list of coefficient matrices
    d <- polyToDistMat(coeffs, method = "logDiff", numThreads = 0)
    # using the absence-presence method
    d <- polyToDistMat(coeffs, method = "ap", numThreads = 0)
```

    treeDist Calculates the distance between trees
    
## Description

Calculates the distance between two trees or a tree and a list of trees.

```
Usage
    treeDist(
        x,
        Y,
        type = c("default", "yEvaluated", "tipLabel"),
        method = c("fraction", "logDiff", "wLogDiff", "pa", "ap"),
        y,
        numThreads = -1
    )
```

## Arguments

| $X$ | single phylo object |
| :--- | :--- |
| $Y$ | a list of phylo objects |
| type | one of: |

"real" tree distinguishing polynomials in two variables $x$ (columns) and y (rows)
"yEvaluated" tree distinguishing polynomials with $y$ evaluated at a specified argument
"tipLabel" complex coefficient polynomial that utilize binary trait tip labels on the phylo objects
method method to use when calculating coefficient distances:
"fraction" for two coefficient matrices A and B returns sum(abs(A-B)/(A+B)), excluding elements where both $A$ and $B$ are zero
"logDiff" for two coefficient matrices A and B returns sum( $\log (1+a b s(A-B))$
"wLogDiff" performs the "logDiff" method with weights on the rows
"pa" total pairs where the coefficient is present in one matrix and absent in the other (presence-absence)
"ap" opposite comparison of pa (absence-presence)
$y$ the $y$ value to evaluate the polynomial at when type is " $y$ Evaluated", ignored otherwise
numThreads number of threads to be used, the default (-1) will use the number of cores in the machine and numThreads $=0$ will only use the main thread

## Value

vector of distances

## Note

- the substituted y coefficient vector only supports the "logDiff" method and the "fraction" method
- "pa" and "ap" force symmetry in the output distance matrix

## Examples

```
library(treenomial)
library(ape)
# distance between one 10 tip tree and 100 trees with 30 tips
# generate the trees
tenTipTree <- rtree(10)
thirtyTipList <- rmtree(100, 30)
# find the distance
treeDist(tenTipTree, thirtyTipList, numThreads = 0)
```

## Description

Finds the Julia Set for the y evaluated polynomial of a tree and plots in a square image.

## Usage

```
    treeJuliaSet(
        tree,
        pixelLength = 700,
        center = 0,
        maxZ = 2,
        maxIter = 100,
        col = c("white", colorRampPalette(c("dodgerblue4", "lightblue"))(98), "black"),
        y
    )
```

## Arguments

| tree | phylo object |
| :--- | :--- |
| pixelLength | number of pixels on one side of the image |
| center | complex number giving the center of the image on the complex plane |
| maxZ | the max value for the real and imaginary axis |
| maxIter | maximum count for iterations |
| col | colours to be used for the image |
| $y$ | the y value to evaluate the polynomial at |

## Examples

```
library(treenomial)
library(ape)
treeJuliaSet(stree(5,type = "right"), y = 1+1i)
```

## Description

Calculates the distance matrix from a list of phylo objects

## Usage

## treeToDistMat(

        trees,
        method = c("fraction", "logDiff", "wLogDiff", "pa", "ap"),
        type = c("default", "yEvaluated", "tipLabel"),
        y,
        numThreads \(=-1\)
    )
    
## Arguments

| trees <br> method | a single phylo object or a list of phylo objects |
| :---: | :---: |
|  | method to use when calculating coefficient distances: |
|  | "fraction" for two coefficient matrices $A$ and $B$ returns $\operatorname{sum}(a b s(A-B) /(A+B))$, excluding elements where both A and B are zero |
|  | "logDiff" for two coefficient matrices A and B returns sum( $\log (1+\mathrm{abs}(\mathrm{A}-\mathrm{B})$ ) |
|  | "wLogDiff" performs the "logDiff" method with weights on the rows |
|  | "pa" total pairs where the coefficient is present in one matrix and absent in the other (presence-absence) |
|  | "ap" opposite comparison of pa (absence-presence) |
| type | one of: |
|  | "real" tree distinguishing polynomials in two variables x (columns) and y (rows) |
|  | "yEvaluated" tree distinguishing polynomials with y evaluated at a specified argument |
|  | "tipLabel"complex coefficient polynomial that utilize binary trait tip labels on the phylo objects |
| y | the $y$ value to evaluate the polynomial at when type is " $y$ Evaluated", ignored otherwise |
| numThreads | number of threads to be used, the default (-1) will use the number of cores in the machine and numThreads $=0$ will only use the main thread |

## Value

a distance matrix

Note

- the substituted y coefficient vector only supports the "logDiff" method and the "fraction" method
- "pa" and "ap" force symmetry in the output distance matrix

## Examples

```
library(treenomial)
library(ape)
# distance matrix for }10\mathrm{ trees of 30 tips
treeToDistMat(rmtree(10, 30), method = "wLogDiff", numThreads = 0)
```

```
treeToPoly Convert trees to coefficient matrices
```

## Description

Converts rooted full binary trees to tree distinguishing polynomials described with coefficient matrices.

```
Usage
    treeToPoly(
        trees,
        type = c("default", "yEvaluated", "tipLabel"),
        y,
        varLabels = FALSE,
        numThreads = -1
    )
```

## Arguments

\(\left.$$
\begin{array}{ll}\text { trees } & \begin{array}{l}\text { a single phylo object or a list of phylo objects } \\
\text { one of: }\end{array}
$$ <br>
"real" tree distinguishing polynomials in two variables x (columns) and y (rows) <br>
"yEvaluated" tree distinguishing polynomials with y evaluated at a specified <br>

argument\end{array}\right]\) "tipLabel"complex coefficient polynomial that utilize binary trait tip labels on $\left.\begin{array}{l}\text { the phylo objects }\end{array}\right]$| the y value to evaluate the polynomial at when type is "yEvaluated", ignored |
| :--- |
| otherwise |

## Value

the resulting coefficient matrix or matrices of the form:
"real" a real matrix where the ith row, $j$ th column represents the $x^{\wedge}(j-1) * y^{\wedge}(i-1)$ coefficient
" $y$ Evaluated" a vector where the kth column represents the $x^{\wedge}(k-1)$ coefficient
"tipLabel" given trees with two unique tip labels "a", "b" a complex matrix where the ith row, jth column represents the $\mathrm{a}^{\wedge}(\mathrm{i}-1)^{*} \mathrm{~b}^{\wedge}(\mathrm{j}-1)$ coefficient

## Examples

```
library(treenomial)
library(ape)
# generate a tree
tree <- rtree(n = 30, rooted = TRUE)
# a real coefficient matrix
treeToPoly(tree, varLabels = TRUE, numThreads = 0)
# complex coefficient vector for the tree
treeToPoly(tree, type = "yEvaluated", y = 1+1i, varLabels = TRUE, numThreads = 0)
# for a list of trees
treeToPoly(rmtree(4, 20), varLabels = TRUE, numThreads = 0)
```

wedge Performs the wedge operation

## Description

Calculates the result from the wedge operation on two real coefficient matrices, two y evaluated polynomial coefficient vectors or two phylo objects.

## Usage

wedge(A, B, type $=c(" d e f a u l t ", ~ " y E v a l u a t e d ", ~ " p h y l o "), ~ y)$

## Arguments

```
A, B two real coefficient matrices, complex coefficient vectors or phylo objects
type one of:
    "real" tree distinguishing polynomials in two variables x (columns) and y (rows)
    "yEvaluated" tree distinguishing polynomials with y evaluated at a specified
        argument
    "tipLabel"complex coefficient polynomial that utilize binary trait tip labels on
        the phylo objects
y the y value to evaluate the polynomial at when type is "yEvaluated", ignored
    otherwise
```

## Value

the wedge result in the same form as the arguments

## Examples

```
library(treenomial)
library(ape)
# wedge two real coefficient matrices
leaf <- matrix(c(0,1), nrow = 1, ncol = 2)
wedge(leaf, leaf)
# wedge two complex coefficient vectors
leaf <- as.complex(c(0,1))
wedge(leaf, leaf, "yEvaluated",5)
```
